<b>1 A Consumer Library Interface to DWARF</b>	<b>1</b>
1.1 Suggestions for improvement are welcome.	2
1.2 Downloading Libdwarf	2
1.3 Introduction	2
1.4 Thread Safety	3
1.5 Error Handling in libdwarf	3
1.5.1 Error Handling at Initialization	3
1.5.2 Error Handling Everywhere	4
1.5.2.1 DW_DLV_OK	5
1.5.2.2 DW_DLV_NO_ENTRY	5
1.5.2.3 DW_DLV_ERROR	5
1.5.2.4 Slight Performance Enhancement	5
1.6 Extracting Data Per Compilation Unit	6
1.7 Line Table Registers	6
1.8 Reading Special Sections Independently	7
1.9 Special Frame Registers	7
1.10 .debug_pubnames etc DWARF2-DWARF4	8
1.11 Reading DWARF with no object file present	9
1.12 Section Groups: Split Dwarf, COMDAT groups	11
1.13 Details on separate DWARF object access	12
1.14 Linking against libdwarf.so (or dll or dylib)	13
1.15 Linking against libdwarf.a	14
1.16 Suppressing CRC calculation for debuglink	14
1.17 Object Reading By User Code	15
1.18 dwsec_mmap	15
1.19 Recent Changes	16
<b>2 JIT and special case DWARF</b>	<b>23</b>
2.1 Reading DWARF not in an object file	23
2.1.1 Describing the Interface	25
2.1.2 Describing A Section	25
2.1.3 Function Pointers	26
<b>3 dwarf.h</b>	<b>29</b>
<b>4 libdwarf.h</b>	<b>31</b>
<b>5 checkexamples.c</b>	<b>33</b>
<b>6 Topic Index</b>	<b>35</b>
6.1 Topics	35
<b>7 Class Index</b>	<b>37</b>
7.1 Class List	37

<b>8 File Index</b>	<b>39</b>
8.1 File List	39
<b>9 Topic Documentation</b>	<b>41</b>
9.1 Basic Library Datatypes Group	41
9.1.1 Detailed Description	41
9.1.2 Typedef Documentation	41
9.1.2.1 Dwarf_Addr	41

9.19 Abbreviations Section Details	173
9.19.1 Detailed Description	174
9.19.2 Function Documentation	174
9.19.2.1 dwarf_get_abbrev()	174
9.19.2.2 dwarf_get_abbrev_children_flag()	175
9.19.2.3 dwarf_get_abbrev_code()	175
9.19.2.4 dwarf_get_abbrev_entry_b()	175
9.19.2.5 dwarf_get_abbrev_tag()	176
9.20 String Section .debug_str Details	177
9.20.1 Detailed Description	177
9.20.2 Function Documentation	177
9.20.2.1 dwarf_get_str()	177
9.21 Str_Offsets section details	178
9.21.1 Detailed Description	178
9.21.2 Function Documentation	178
9.21.2.1 dwarf_close_str_offsets_table_access()	178
9.21.2.2 dwarf_next_str_offsets_table()	179
9.21.2.3 dwarf_open_str_offsets_table_access()	180
9.21.2.4 dwarf_str_offsets_statistics()	180
9.21.2.5 dwarf_str_offsets_value_by_index()	180
9.22 Dwarf_Error Functions	181
9.22.1 Detailed Description	181
9.22.2 Function Documentation	181
9.22.2.1 dwarf_dealloc_error()	181
9.22.2.2 dwarf_errmsg()	182
9.22.2.3 dwarf_errmsg_by_number()	182
9.22.2.4 dwarf_errno()	182
9.22.2.5 dwarf_error_creation()	183
9.23 Generic dwarf_dealloc Function	183
9.23.1 Detailed Description	183
9.23.2 Function Documentation	184
9.23.2.1 dwarf_dealloc()	184
9.24 Access to Section .debug_sup	184
9.24.1 Detailed Description	184
9.24.2 Function Documentation	184
9.24.2.1 dwarf_get_debug_sup()	184
9.25 Fast Access to .debug_names DWARF5	185
9.25.1 Detailed Description	186
9.25.2 Function Documentation	186
9.25.2.1 dwarf_dealloc_dnames()	186
9.25.2.2 dwarf_dnames_abbrevtable()	186

9.25.2.3 dwarf_dnames_bucket()	187
9.25.2.4 dwarf_dnames_cu_table()	187
9.25.2.5 dwarf_dnames_entrypool()	188
9.25.2.6 dwarf_dnames_entrypool_values()	189
9.25.2.7 dwarf_dnames_header()	190
9.25.2.8 dwarf_dnames_name()	190
9.25.2.9 dwarf_dnames_offsets()	191
9.25.2.10 dwarf_dnames_sizes()	192
9.26 Fast Access to a CU given a code address	192
9.26.1 Detailed Description	193
9.26.2 Function Documentation	193
9.26.2.1 dwarf_get_arange()	193
9.26.2.2 dwarf_get_arange_cu_header_offset()	193
9.26.2.3 dwarf_get_arange_info_b()	194
9.26.2.4 dwarf_get_aranges()	194
9.26.2.5 dwarf_get_cu_die_offset()	195
9.27 Fast Access to .debug_pubnames and more.	195
9.27.1 Detailed Description	196
9.27.2 Function Documentation	196

## 1.1 Suggestions for improvement are welcome.

Your thoughts on the document?

A) Are the section and subsection titles on Main Page meaningful to you?

B) Are the titles on the Modules page meaningful to you?

Anything else you find misleading or confusing? Send suggestions to ( libdwarf (at) linuxmail with final characters .org ). Sorry about the simple obfuscation to keep bots away.

Thanks in advance for any suggestions.

## 1.2 Downloading Libdwarf

Project page is at <https://github.com/davea42/libdwarf-code>

There is a Releases area on the project page, click Latest and you will be presented with options to download the source in three different forms.

For details on licensing, see COPYING in the files list.

README.md may be of interest (automatically shown on the project page on github..

Examples of using libdwarf are in [doc/checkexamples.c](#) and `src/bin/dwarfexamples`.

To download source, one can also do:

```
git clone https://github.com/davea42/libdwarf-code code
```

Some tests simply assume the project source base name is `code` which is why the above is as shown. This is a grave historical misfeature that needs to be fixed in the test scripts.

## 1.3 Introduction

This document describes an interface to *libdwarf*, a library of functions to provide access to DWARF debugging information records, DWARF line number information, DWARF address range and global names information, weak names information, DWARF frame description information, DWARF static function names, DWARF static variables, and DWARF type information. In addition the library provides access to several object sections (created by compiler writers and for debuggers) related to debugging but not mentioned in any DWARF standard.

The DWARF Standard has long mentioned the "Unix International Programming Languages Special Interest Group" (PLSIG), under whose auspices the DWARF committee was formed around 1991. "Unix International" was disbanded in the 1990s and no longer exists.

The DWARF committee published DWARF2 July 27, 1993, DWARF3 in 2005, DWARF4 in 2010, and DWARF5 in 2017.

In the mid 1990s this document and the library it describes (which the committee never endorsed, having decided not to endorse or approve any particular library interface) was made available on the internet by Silicon Graphics, Inc.

In 2005 the DWARF committee began an affiliation with FreeStandards.org. In 2007 FreeStandards.org merged with The Linux Foundation. The DWARF committee dropped its affiliation with FreeStandards.org in 2007 and established the dwarfstd.org website.

See also

<https://www.dwarfstd.org> for current information on standardization activities and a copy of the standard.

## 1.4 Thread Safety

Libdwarf can safely open multiple Dwarf\_Debug pointers simultaneously but all such Dwarf\_Debug pointers must be opened within the same thread. And all *libdwarf* calls must be made from within that single (same) thread.

## 1.5 Error Handling in libdwarf

Essentially every *libdwarf* call could involve dealing with an error (possibly data corruption in the object file). Here we explain the two main approaches the library provides (though we think only one of them is truly appropriate except in toy programs). In all cases where the library returns an error code (almost every library function does) the caller should check whether the returned integer is DW\_DLV\_OK, DW\_DLV\_ERROR, or DW\_DLV\_NO\_ENTRY and then act accordingly.

**A) The recommended approach** is to define a Dwarf\_Error and initialize it to 0.

```
Dwarf_Error error = 0;
```

Then, in every call where there is a Dwarf\_Error argument pass its address. For example:

```
int res = dwarf_tag(die,DW_TAG_compile_unit,&error);
```

The possible return values to res are, in general:

```
DW_DLV_OK
DW_DLV_NO_ENTRY
DW_DLV_ERROR
```

If **DW\_DLV\_ERROR** is returned then error is set (by the library) to a pointer to important details about the error and the library will not pass back any data through other pointer arguments. If **DW\_DLV\_NO\_ENTRY** is returned the error argument is ignored by the library and the library will not pass back any data through pointer arguments. If **DW\_DLV\_OK** is returned argument pointers that are defined as ways to return data to your code are used and values are set in your data by the library.

Some functions cannot possibly return some of these three values. As defined later for each function.

**B) An alternative (not recommended)** approach is to pass NULL to the error argument.

```
int res = dwarf_tag(die,DW_TAG_compile_unit,NULL);
```

If your initialization provided an 'errhand' function pointer argument (see below) the library will call errhand if an error is encountered. (Your errhand function could exit if you so choose.)

The the library will then return DW\_DLV\_ERROR, though you will have no way to identify what the error was. Could be a malloc fail or data corruption or an invalid argument to the call, or something else.

That is the whole picture. The library never calls exit() under any circumstances.

### 1.5.1 Error Handling at Initialization

Each initialization call (for example)

```
Dwarf_Debug dbg = 0;
const char *path = "myobjectfile";
char *true_path = 0;
unsigned int true_pathlen = 0;
Dwarf_Handler errhand = 0;
Dwarf_Ptr errarg = 0;
Dwarf_Error error = 0;
int res = 0;

res = dwarf_init_path(path,true_path,true_pathlen,
    DW_GROUPNUMBER_ANY,errhand,errarg,&dbg,&error);
```

has two arguments that appear nowhere else in the library.

```
Dwarf_Handler errhand
Dwarf_Ptr      errarg
```

For the **recommended A)** approach:

Just pass NULL to both those arguments. If the initialization call returns DW\_DLV\_ERROR you should then call `dwarf_dealloc_error (dbg, error);`

to free the Dwarf\_Error data because `dwarf_finish()` does not clean up a dwarf-init error. This works even though `dbg` will be NULL.

For the **not recommended B)** approach:

Because `dw_errarg` is a general pointer one could create a struct with data of interest and use a pointer to the struct as the `dw_errarg`. Or one could use an integer or NULL, it just depends what you want to do in the Dwarf\_Handler function you write.

If you wish to provide a `dw_errhand`, define a function (this first example is not a good choice as it terminates the application!).

```
void bad_dw_errhandler(Dwarf_Error error, Dwarf_Ptr ptr)
{
    printf("ERROR Exit on %lx due to error 0x%lx %s\n",
        (unsigned long)ptr,
        (unsigned long)dwarf_errno(error),
        dwarf_errmsg(error));
    exit(1)
}
```

and pass `bad_dw_errhandler` (as a function pointer, no parentheses).

The Dwarf\_Ptr argument your error handler function receives is the value you passed in as `dw_errarg`, and can be anything, it allows you to associate the callback with a particular `dwarf_init*` call if you wish to make such an association.

By doing an `exit()` you guarantee that your application abruptly stops. This is only acceptable in toy or practice programs.

A better `dw_errhand` function is

```
void my_dw_errhandler(Dwarf_Error error, Dwarf_Ptr ptr)
{
    /* Clearly one could write to a log file or do
       whatever the application finds useful. */
    printf("ERROR on %lx due to error 0x%lx %s\n",
        (unsigned long)ptr,
        (unsigned long)dwarf_errno(error),
        dwarf_errmsg(error));
}
```

because it returns rather than exiting. It is not ideal. The DW\_DLV\_ERROR code is returned from *libdwarf* and your code can do what it likes with the error situation. The library will continue from the error and will return an error code on returning to your `@libdwarf` call ... but the calling function will not know what the error was.

```
Dwarf_Ptr x = address of some struct I want in the errhandler;
res = dwarf_init_path(..., my_dw_errhandler, x, ... );
if (res == ...)
```

If you do not wish to provide a `dw_errhand`, just pass both arguments as NULL.

## 1.5.2 Error Handling Everywhere

So let us examine a simple case where anything could happen. We are taking the **recommended A)** method of using a non-null Dwarf\_Error\*:

```
int func(Dwarf_Dbg dbg, Dwarf_Die die, Dwarf_Error* error) {
    Dwarf_Die newdie = 0;
    int res = 0;

    res = dwarf_siblingof_c(die, &newdie, error);
    if (res != DW_DLV_OK) {
        /* Whether DW_DLV_ERROR or DW_DLV_NO_ENTRY
           (the latter is actually impossible
           for this function) returning res is the
           appropriate default thing to do. */
        return res;
    }
    /* Do something with newdie. */
    dwarf_dealloc_die(newdie);
    newdie = 0; /* A good habit... */
    return DW_DLV_OK;
}
```

### 1.5.2.1 DW\_DLV\_OK

When `res == DW_DLV_OK` `newdie` is a valid pointer and when appropriate we should do `dwarf_dealloc_die(newdie)`. For other *libdwarf* calls the meaning depends on the function called, so read the description of the function you called for more information.

### 1.5.2.2 DW\_DLV\_NO\_ENTRY

When `res == DW_DLV_NO_ENTRY` then `newdie` is not set and there is no error. It means `die` was the last of a siblinglist. For other *libdwarf* calls the meaning depends on the function called, so read the description of the function you called for more information.

### 1.5.2.3 DW\_DLV\_ERROR

When `res == DW_DLV_ERROR` Something bad happened. The only way to know what happened is to examine the `*error` as in

```
int ev = dwarf_errno(*error);
or
char * msg = dwarf_errmsg(*error);
```

or both and report that somehow.

The above three values are the only returns possible from the great majority of *libdwarf* functions, and for these functions the return type is always `int`.

If it is a decently large or long-running program then you want to free any local memory you allocated and return `res`. If it is a small or experimental program print something and exit (possibly leaking memory).

If you want to discard the error report from the `dwarf_siblingof_c()` call then possibly do

```
dwarf_dealloc_error(dbg, *error);
*error = 0;
return DW_DLV_OK;
```

Except in a special case involving function `dwarf_set_de_alloc_flag()` (which you will not usually call), any `dwarf_dealloc()` that is needed will happen automatically when you call `dwarf_finish()`.

### 1.5.2.4 Slight Performance Enhancement

Very long running library access programs using relevant appropriate `dwarf_dealloc` calls should consider calling `dwarf_set_de_alloc_flag(0)`. Using this one could get a performance enhancement of perhaps five percent in *libdwarf* CPU time and a reduction in memory use.

Be sure to test using `valgrind` (at runtime) or the gcc option `-fsanitize` at compile time and run tests appropriately to ensure your code really does the extra `dwarf_dealloc` calls needed since when using `dwarf_set_de_alloc_flag(0)` `dwarf_finish()` does only limited cleanup.

## 1.6 Extracting Data Per Compilation Unit

The library is designed to run a single pass through the set of Compilation Units (CUs), via a sequence of calls to [dwarf\\_next\\_cu\\_header\\_e\(\)](#). ([dwarf\\_next\\_cu\\_header\\_d\(\)](#) is supported but its use requires that it be immediately followed by a call to [dwarf\\_siblingof\\_b\(\)](#). see [dwarf\\_next\\_cu\\_header\\_d\(\)](#). )

Within a CU opened with [dwarf\\_next\\_cu\\_header\\_e\(\)](#) do something (if desired) on the CU\_DIE returned, and call [dwarf\\_child\(\)](#) on the CU\_DIE to begin recursing through all DIEs. If you save the CU\_DIE you can repeat passes beginning with [dwarf\\_child\(\)](#) on the CU\_DIE, though it almost certainly faster to remember, in your data structures, what you need from the first pass.

The general plan:

create your local data structure(s)

- A. Check your local data structures to see **if** you have what you need
- B. If sufficient data present act on it, ensuring your data structures are kept **for** further use.
- C. Otherwise Read a CU, recording relevant data in your structures and loop back to A.

For an example (best approach)

See also

[Example walking CUs\(e\)](#) or (second-best approach)

[Example walking CUs\(d\)](#) Write your code to record relevant (to you) information from each CU as you go so your code has no need for a second pass through the CUs. This is much much faster than allowing multiple passes would be.

## 1.7 Line Table Registers

Line Table Registers

Please refer to the DWARF5 Standard for details. The line table registers are named in Section 6.2.2 State Machine Registers and are not much changed from DWARF2.

Certain functions on Dwarf\_Line data return values for these 'registers' as these are the data available for debuggers and other tools to relate a code address to a source file name and possibly also to a line number and column-number within the source file.

```
address
op_index
file
line
column
is_stmt
basic_block
end_sequence
prologue_end
epilogue_begin
isa
discriminator
```

## 1.8 Reading Special Sections Independently

DWARF defines (in each version of DWARF) sections which have a somewhat special character. These are referenced from compilation units and other places and the Standard does not forbid blocks of random bytes at the start or end or between the areas referenced from elsewhere.

Sometimes compilers (or linkers) leave trash behind as a result of optimizations. If there is a lot of space wasted that way it is quality of implementation issue. But usually the wasted space, if any, is small.

Compiler writers or others may be interested in looking at these sections independently so *libdwarf* provides functions that allow reading the sections without reference to what references them.

[Abbreviations can be read independently](#)

[Strings can be read independently](#)

[String Offsets can be read independently](#)

[The addr table can be read independently](#)

Those functions allow starting at byte 0 of the section and provide a length so you can calculate the next section offset to call or refer to.

Usually that works fine. If there is some random data somewhere outside of referenced areas or the data format is a gcc extension of an early DWARF version the reader function may fail, returning `DW_DLV_ERROR`. Such an error is neither a compiler bug nor a *libdwarf* bug.

## 1.9 Special Frame Registers

In dealing with `.debug_frame` or `.eh_frame` there are five values that must be set unless one has relatively few registers in the target ABI (anything under 188 registers, see [dwarf.h](#) `DW_FRAME_LAST_REG_NUM` for this default).

The requirements stem from the design of the section. See the DWARF5 Standard for details. The `.debug_frame` section is basically the same from DWARF2 on. The `.eh_frame` section is similar to `.debug_frame` but is intended to support exception handling and has fields and data not present in `.debug_frame`.

Keep in mind that register values correspond to columns in the theoretical fully complete line table of a row per pc and a column per register.

There is no time or space penalty in setting **Undefined\_Value**, **Same\_Value**, and **CFA\_Column** much larger than the **Table\_Size**.

Here are the five values.

**Table\_Size:** This sets the number of columns in the theoretical table. It starts at `DW_FRAME_LAST_REG_NUM` which defaults to 188. This is the only value you might need to change, given the defaults of the others are set reasonably large by default. Setting this higher than necessary wastes cpu time and memory space.

**Undefined\_Value:** A register number that means the register value is undefined. For example due to a call clobbering the register. `DW_FRAME_UNDEFINED_VAL` defaults to 12288. There no such column in the table.

**Same\_Value:** A register number that means the register value is the same as the value at the call. Nothing can have clobbered it. `DW_FRAME_SAME_VAL` defaults to 12289. There no such column in the table.

**Initial\_Value:** The value must be either DW\_FRAME\_UNDEFINED\_VAL or DW\_FRAME\_SAME\_VAL to represent how most registers are to be thought of at a function call. This is a property of the ABI and instruction set. Specific frame instructions in the CIE or FDE will override this for registers not matching this value.

**CFA\_Column:** A number for the CFA. Defined so we can use a register number to refer to it. DW\_FRAME\_CFA\_↵\_COL defaults to 12290. There no such column in the table. See [libdwarf.h](#) struct [Dwarf\\_Regtable3\\_s](#) member [rt3\\_cfa\\_rule](#) or function [dwarf\\_get\\_fde\\_info\\_for\\_cfa\\_reg3\\_b\(\)](#) or function [dwarf\\_get\\_fde\\_info\\_for\\_cfa\\_reg3\\_c\(\)](#) .

A set of functions allow these to be changed at runtime. The set should be called (if needed) immediately after initializing a Dwarf\_Debug and before any other calls on that Dwarf\_Debug. If just one value (for example, Table\_↵\_Size) needs altering, then just call that single function.

For the library accessing frame data to work properly there are certain invariants that must be true once the set of functions have been called.

#### REQUIRED:

```
Table_Size      > the number of registers in the ABI.
Undefined_Value != Same_Value
CFA_Column      != Undefined_value
CFA_Column      != Same_value
Initial_Value   == Same_Value ||
                (Initial_Value == Undefined_value)
Undefined_Value > Table_Size
Same_Value      > Table_Size
CFA_Column      > Table_Size
```

If these conditions are not honored the library will return a DW\_DLV\_ERROR code rather than use an improper set of values.

## 1.10 .debug\_pubnames etc DWARF2-DWARF4

Each section consists of a header for a specific compilation unit (CU) followed by an a set of tuples, each tuple consisting of an offset of a compilation unit followed by a null-terminated namestring. The tuple set is ended by a 0,0 pair. Then followed with the data for the next CU and so on.

The function set provided for each such section allows one to print all the section data as it literally appears in the section (with headers and tuples) or to treat it as a single array with CU data columns.

Each has a set of 6 functions.

Section	typename	Standard
.debug_pubnames	<a href="#">Dwarf_Global</a>	DWARF2-DWARF4
.debug_pubtypes	<a href="#">Dwarf_Global</a>	DWARF3, DWARF4

These sections are accessed calling [dwarf\\_globals\\_by\\_type\(\)](#) using type of DW\_GL\_GLOBALS or DW\_GL\_↵PUBTYPES. Or call [dwarf\\_get\\_pubtypes\(\)](#).

The following four were defined in SGI/IRIX compilers in the 1990s but were never part of the DWARF standard. These sections are accessed calling [dwarf\\_globals\\_by\\_type\(\)](#) using type of DW\_GL\_FUNCS, DW\_GL\_↵TYPES, DW\_GL\_VARS, or DW\_GL\_WEAKS.

It not likely you will encounter these four sections.

```
.debug_funcs
.debug_typenames
.debug_vars
.debug_weaks
```

## 1.11 Reading DWARF with no object file present

This most commonly happens with just-in-time compilation, and someone working on the code wants to debug this on-the-fly code in a situation where nothing can be written to disc, but DWARF can be constructed in memory.

For a simple example of this

See also

[Demonstrating reading DWARF without a file.](#)

But the *libdwarf* feature can be used in a wide variety of ways.

For example, the DWARF data could be kept in simple files of bytes on the internet. Or on the local net. Or if files can be written locally each section could be kept in a simple stream of bytes in the local file system.

Another example is a non-standard file system, or file format, with the intent of obfuscating the file or the DWARF.

For this to work the code generator must generate standard DWARF.

Overall the idea is a simple one: You write a small handful of functions and supply function pointers and code implementing the functions. These are part of your application or library, not part of *libdwarf*.

You set up a little bit of data with that code (all described below) and then you have essentially written the dwarf↵\_init\_path equivalent and you can access compilation units, line tables etc and the standard *libdwarf* function calls work.

Take great care in your object reader code because any failure to reject object files with corrupt data in areas such as object headers, section headers, or relocation records nullifies the intended guarantee that the library will not crash.

Data you need to create involves these types. What follows describes how to fill them in and how to make them work for you.

```
typedef struct Dwarf_Obj_Access_Interface_a_s
Dwarf_Obj_Access_Interface_a;
struct Dwarf_Obj_Access_Interface_a_s {
    void*      ai_object;
    const Dwarf_Obj_Access_Methods_a *ai_methods;
};

typedef struct Dwarf_Obj_Access_Methods_a_s
Dwarf_Obj_Access_Methods_a
struct Dwarf_Obj_Access_Methods_a_s {
    int      (*om_get_section_info)(void* obj,
        Dwarf_Unsigned section_index,
        Dwarf_Obj_Access_Section_a* return_section,
        int* error);
    Dwarf_Small      (*om_get_byte_order)(void* obj);
    Dwarf_Small      (*om_get_length_size)(void* obj);
    Dwarf_Small      (*om_get_pointer_size)(void* obj);
    Dwarf_Unsigned    (*om_get_filesize)(void* obj);

    Dwarf_Unsigned    (*om_get_section_count)(void* obj);
    int      (*om_load_section)(void* obj,
        Dwarf_Unsigned section_index,
        Dwarf_Small** return_data, int* error);
    int      (*om_relocate_a_section)(void* obj,
        Dwarf_Unsigned section_index,
        Dwarf_Debug dbg,
        int* error);
};

typedef struct Dwarf_Obj_Access_Section_a_s
Dwarf_Obj_Access_Section_a
struct Dwarf_Obj_Access_Section_a_s {
    const char*      as_name;
    Dwarf_Unsigned    as_type;
    Dwarf_Unsigned    as_flags;
    Dwarf_Addr        as_addr;
};
```

```

Dwarf_Unsigned as_offset;
Dwarf_Unsigned as_size;
Dwarf_Unsigned as_link;
Dwarf_Unsigned as_info;
Dwarf_Unsigned as_addralign;
Dwarf_Unsigned as_entsize;
};

```

**Dwarf\_Obj\_Access\_Section\_a:** Your implementation of a **om\_get\_section\_info** must fill in a few fields for *libdw*. The fields here are standard Elf, but for most you can just use the value zero. We assume you will not be doing relocations at runtime and do not describe how to do relocations.

**as\_name:** Here you set a section name via the pointer. The section names must be names as defined in the DWARF standard, so if such do not appear in your data you have to create the strings yourself.

**as\_type:** Fill in zero.

**as\_flags:** Fill in zero.

**as\_addr:** Fill in the address, in local memory, where the bytes of the section are.

**as\_offset:** Fill in zero.

**as\_size:** Fill in the size, in bytes, of the section you are telling *libdw* about.

**as\_link:** Fill in zero.

**as\_info:** Fill in zero.

**as\_addralign:** Fill in zero.

**as\_entsize:** Fill in one(1).

**Dwarf\_Obj\_Access\_Methods\_a\_s:** The functions we need to access object data from *libdw* are declared here.

In these function pointer declarations 'void \*obj' is intended to be a pointer (the object field in Dwarf\_Obj\_Access\_Interface\_s) that hides the library-specific and object-specific data that makes it possible to handle multiple object formats and multiple libraries. It is not required that one handles multiple such in a single *libdw* archive/shared-library (but not ruled out either). See dwarf\_elf\_object\_access\_internals\_t and dwarf\_elf\_access.c for an example.

Usually the struct **Dwarf\_Obj\_Access\_Methods\_a\_s** is statically defined and the function pointers are set at compile time.

The om\_get\_filesize member is new September 4, 2021. Its position is NOT at the end of the list. The member names all now have om\_ prefix.

## 1.12 Section Groups: Split Dwarf, COMDAT groups

A typical executable or shared object is unlikely to have any section groups as the linker would have removed those when building an executable or shared-object, and in that case what follows is irrelevant and unimportant.

**COMDAT** groups are defined by the Elf ABI and enable compilers and linkers to work together to eliminate blocks of duplicate DWARF and duplicate CODE.

**Split Dwarf** (sometimes referred to as Debug Fission) allows compilers and linkers to separate large amounts of DWARF from the executable, shrinking disk space needed in the executable while allowing full debugging (also applies to shared objects).

See the DWARF5 Standard, Section E.1 Using Compilation Units page 364.

To name COMDAT groups (defined later here) we add the following defines to [libdwarf.h](#) (the DWARF standard does not specify how to do any of this).

```
/* These support opening DWARF5 split dwarf objects and
   Elf SHT_GROUP blocks of DWARF sections. */
#define DW_GROUPNUMBER_ANY 0
#define DW_GROUPNUMBER_BASE 1
#define DW_GROUPNUMBER_DWO 2
```

The DW\_GROUPNUMBER\_ are used in *libdwarf* functions [dwarf\\_init\\_path\(\)](#), [dwarf\\_init\\_path\\_dl\(\)](#) and [dwarf\\_init\\_b\(\)](#). In all those cases unless you know there is any complexity in your object file, pass in DW\_↵GROUPNUMBER\_ANY.

To see section groups usage, see the example source:

See also

[A simple report on section groups.](#)  
[Examining Section Group data](#)

The function interface declarations:

See also

[dwarf\\_sec\\_group\\_sizes](#)  
[dwarf\\_sec\\_group\\_map](#)

If an object file has multiple groups *libdwarf* will not reveal contents of more than the single requested group with a given [dwarf\\_init\\_path\(\)](#) call. One must pass in another groupnumber to another [dwarf\\_init\\_path\(\)](#), meaning initialize a new Dwarf\_Debug, to get *libdwarf* to access that group.

When opening a Dwarf\_Debug the following applies:

If DW\_GROUPNUMBER\_ANY is passed in *libdwarf* will choose either of DW\_GROUPNUMBER\_BASE(1) or DW\_↵GROUPNUMBER\_DWO (2) depending on the object content. If both groups one and two are in the object *libdwarf* will chose DW\_GROUPNUMBER\_BASE.

If DW\_GROUPNUMBER\_BASE is passed in *libdwarf* will choose it if non-split DWARF is in the object, else the init call will return DW\_DLV\_NO\_ENTRY.

If DW\_GROUPNUMBER\_DWO is passed in *libdwarf* will choose it if .dwo sections are in the object, else the init will call return DW\_DLV\_NO\_ENTRY.

If a groupnumber greater than two is passed in *libdwarf* accepts it, whether any sections corresponding to that groupnumber exist or not. If the groupnumber is not an actual group the init will call return DW\_DLV\_NO\_ENTRY.

For information on groups "dwarfdump -i" on an object file will show all section group information **unless** the object file is a simple standard object with no .dwo sections and no COMDAT groups (in which case the output will be silent on groups). Look for **Section Groups data** in the dwarfdump output. The groups information will be appearing very early in the dwarfdump output.

Sections that are part of an Elf COMDAT GROUP are assigned a group number  $> 2$ . There can be many such COMDAT groups in an object file (but none in an executable or shared object). Each such COMDAT group will have a small set of sections in it and each section in such a group will be assigned the same group number by *libdwarf*.

Sections that are in a .dwp .dwo object file are assigned to DW\_GROUPNUMBER\_DWO,

Sections not part of a .dwp package file or a.dwo section, or a COMDAT group are assigned DW\_GROUPNUMBER\_BASE.

At least one compiler relies on relocations to identify COMDAT groups, but the compiler authors do not publicly document how this works so we ignore such (these COMDAT groups will result in *libdwarf* returning DW\_DLV\_ERROR).

Popular compilers and tools are using such sections. There is no detailed documentation that we can find (so far) on how the COMDAT section groups are used, so *libdwarf* is based on observations of what compilers generate.

## 1.13 Details on separate DWARF object access

There are, at present, three distinct approaches in use to put DWARF information into separate objects to significantly shrink the size of the executable. All of them involve identifying a separate file.

Split Dwarf is one method. It defines the attribute **DW\_AT\_dwo\_name** (if present) as having a file-system appropriate name of the split object with most of the DWARF.

The second is MacOS dSYM. It is a convention of placing the DWARF-containing object (separate from the object containing code) in a specific subdirectory tree.

The third involves GNU debuglink and GNU debug\_id. These are two distinct ways (outside of DWARF) to provide names of alternative DWARF-containing objects elsewhere in a file system.

If one initializes a Dwarf\_Debug object with `dwarf_init_path()` or `dwarf_init_path_dl()` appropriately *libdwarf* will automatically open the alternate dSYM or debuglink/debug\_id object on the object with most of the DWARF.

See also

<https://sourceware.org/gdb/onlinedocs/gdb/Separate-Debug-Files.html>

*libdwarf* provides means to automatically read the alternate object (in place of the one named in the init call) or to suppress that and read the named object file.

```
int dwarf_init_path(const char * dw_path,
char * dw_true_path_out_buffer,
unsigned int dw_true_path_bufferlen,
unsigned int dw_groupnumber,
Dwarf_Handler dw_errhand,
Dwarf_Ptr dw_errarg,
Dwarf_Debug* dw_dbg,
Dwarf_Error* dw_error);

int dwarf_init_path_dl(const char *dw_path,
char * true_path_out_buffer,
unsigned true_path_bufferlen,
unsigned groupnumber,
Dwarf_Handler errhand,
Dwarf_Ptr errarg,
Dwarf_Debug * ret_dbg,
char ** dl_path_array,
```

```
unsigned int    dl_path_count,
unsigned char  * path_source,
Dwarf_Error    * error);
```

Case 1:

If *dw\_true\_path\_out\_buffer* or *dw\_true\_path\_bufferlen* is passed in as zero then the library will not look for an alternative object.

Case 2:

If *dw\_true\_path\_out\_buffer* passes a pointer to space you provide and *dw\_true\_path\_bufferlen* passes in the length, in bytes, of the buffer, *libdwarf* will look for alternate DWARF-containing objects. We advise that the caller zero all the bytes in *dw\_true\_path\_out\_buffer* before calling.

If the alternate object name (with its null-terminator) is too long to fit in the buffer the call will return DW\_DLV\_ERROR with *dw\_error* providing error code DW\_DLE\_PATH\_SIZE\_TOO\_SMALL.

If the alternate object name fits in the buffer *libdwarf* will open and use that alternate file in the returned Dwarf\_Dbg.

It is up to callers to notice that *dw\_true\_path\_out\_buffer* now contains a string and callers will probably wish to do something with the string.

If the initial byte of *dw\_true\_path\_out\_buffer* is a non-null when the call returns then an alternative object was found and opened.

The second function, *dwarf\_init\_path\_dl()*, is the same as *dwarf\_init\_path()* except the *\_dl* version has three additional arguments, as follows:

Pass in NULL or *dw\_dl\_path\_array*, an array of pointers to strings with alternate GNU debuglink paths you want searched. For most people, passing in NULL suffices.

Pass in *dw\_dl\_path\_array\_size*, the number of elements in *dw\_dl\_path\_array*.

Pass in *dw\_dl\_path\_source* as NULL or a pointer to char. If non-null *libdwarf* will set it to one of three values:

- DW\_PATHSOURCE\_basic which means the original input *dw\_path* is the one opened in *dw\_dbg*.
- DW\_PATHSOURCE\_dsym which means a MacOS dSYM object was found and is the one opened in *dw\_dbg*. *dw\_true\_path\_out\_buffer* contains the dSYM object path.
- DW\_PATHSOURCE\_debuglink which means a GNU debuglink or GNU debug-id path was found and names the one opened in *dw\_dbg*. *dw\_true\_path\_out\_buffer* contains the object path.

## 1.14 Linking against libdwarf.so (or dll or dylib)

If you wish to do the basic *libdwarf* tests and are linking against a shared library *libdwarf* you must do an install for the tests to succeed (in some environments it is not strictly necessary).

For example, if building with configure, do

```
make
make install
make check
```

You can install anywhere, there is no need to install in a system directory! Creating a temporary directory and installing there suffices. If installed in appropriate system directories that works too.

When compiling to link against a shared library *libdwarf* you **must not define** *LIBDWARF\_STATIC*.

For examples of this for all three build systems read the project shell script

```
scripts/allsimplebuilds.sh
```

## 1.15 Linking against libdwarf.a

- If you are building an application
- And are linking your application against a static library libdwarf.a
- Then you must ensure that each source file compilation with an include of [libdwarf.h](#) has the macro **LIBDWARF\_STATIC** defined to your source compilation.
- If *libdwarf* was built with zlib and zstd decompression library enabled you must add -lz -lzstd to the link line of the build of your application.

To pass **LIBDWARF\_STATIC** to the preprocessor with Visual Studio:

- Right click on a project name
- In the contextual menu, click on **Properties** at the very bottom.
- In the new window, double click on **C/C++**
- On the right, click on **Preprocessor definitions**
- There is a small down arrow on the right, click on it then click on **Modify**
- Add **LIBDWARF\_STATIC** to the values
- Click on **OK** to close the windows

## 1.16 Suppressing CRC calculation for debuglink

GNU Debuglink-specific issue:

If GNU debuglink is present and considered by [dwarf\\_init\\_path\(\)](#) or [dwarf\\_init\\_path\\_dl\(\)](#) the library may be required to compute a 32bit crc (Cyclic Redundancy Check) on the file found via GNU debuglink.

See also

[https://en.wikipedia.org/wiki/Cyclic\\_redundancy\\_check](https://en.wikipedia.org/wiki/Cyclic_redundancy_check)

For people doing repeated builds of objects using such the crc check is a waste of time as they know the crc comparison will pass.

For such situations a special interface function lets the [dwarf\\_init\\_path\(\)](#) or [dwarf\\_init\\_path\\_dl\(\)](#) caller suppress the crc check without having any effect on anything else in *libdwarf*.

It might be used as follows (the same pattern applies to [dwarf\\_init\\_path\\_dl\(\)](#)) for any program that might do multiple [dwarf\\_init\\_path\(\)](#) or [dwarf\\_init\\_path\\_dl\(\)](#) calls in a single program execution.

```
int res = 0;
int crc_check = 0;

crc_check = dwarf_suppress_debuglink_crc(1);
res = dwarf_init_path(..usual arguments);
/* Reset the crc flag to previous value. */
dwarf_suppress_debuglink_crc(crc_check);
/* Now check res in the usual way. */
```

This pattern ensures the crc check is suppressed for this single [dwarf\\_init\\_path\(\)](#) or [dwarf\\_init\\_path\\_dl\(\)](#) call while leaving the setting unchanged for further [dwarf\\_init\\_path\(\)](#) or [dwarf\\_init\\_path\\_dl\(\)](#) calls in the running program.

## 1.17 Object Reading By User Code

With the usual libdwf initialization functions the library does extensive checks of object formats and attempts to find all object errors and returns error codes reading objects with errors affecting the library. Including, for example, object header errors and relocation section errors. The intent is to return correct output for correct DWARF and avoid program crashes in the library when the object or DWARF data is corrupt (returning error codes as appropriate).

`dwarf_object_init_b()` is an alternative to the usual libdwf initialization functions – making it possible to read object formats libdwf knows nothing about. This interface delegates the object reading to user code.

`dwarf_object_init_b()` requires the user code to provide correct and complete section information for the sections the library requires. The library cannot guarantee correct, successful, crash-free operation if the user code reading an object is insufficiently careful, thorough, and consistent in returning `DW_DLV_OK`, `DW_DLV_NO_ENTRY`, and `DW_DLV_ERROR` as applicable.

## 1.18 dwsec\_mmap

As of version 0.12.0 libdwf allows callers to select mmap (instead of malloc/read) to access object section DWARF data. Even if mmap is selected it is possible libdwf will chose to use malloc in specific cases.

If at library build time the required functions/header are not available the following will have no effect.

One way to select mmap is to call

```
dwarf_set_load_preference(Dwarf_Alloc_Mmap);
```

Another way to select mmap is with an environment variable

```
export DWARF_WHICH_ALLOC=mmap
```

so libdwf will see the variable at runtime.

The environment variable overrides the function call.

Calling `dwarf_set_load_preference(0)` will return the current overall preference will return the current overall preference, an instance of

```
enum Dwarf_Sec_Alloc_Pref
```

The new function

```
dwarf_get_mmap_count(Dwarf_Debug dw_dbg)
```

returns the application count and size of allocations for DWARF sections from the open `Dwarf_Debug` pointer.

Each supported build environment has a new build option to prevent libdwf from assuming that things in the build are always present.

## 1.19 Recent Changes

We list these with newest first.

### Changes 2.2.0 to 2.3.0

Released 1 February 2026

Added function [dwarf\\_iterate\\_fde\\_all\\_regs3\(\)](#) which lets callers get all rows of the `.debug_frame` and `.eh_frame` sections via callbacks the function makes to a function you write. Simple to use and, for FDEs with many rows, sixty times faster. A prerelease version failed to allow retrieving the CFA pseudo-register value, but that is fixed. See `dwarfexample/frame2.c` for an example of use.

Added function [dwarf\\_set\\_harmless\\_errors\\_enabled\( Dwarf\\_Debug dw\\_dbg,int dw\\_v\)](#). Passing in `dw_v` of 0 (zero) turns off checking for what are really harmless errors, which makes a meaningful improvement in library performance for some calls. By default harmless errors are checked-for.

[dwarf\\_set\\_frame\\_rule\\_table\\_size\(\)](#) now allows setting register rules table size as low as 40 entries. The default remains arbitrary: `DW_FRAME_LAST_REG_NUM` (189) as that suffices for most architectures without being excessive.

Now calls to [dwarf\\_set\\_frame\\_rule\\_initial\\_value\(\)](#), [dwarf\\_set\\_frame\\_rule\\_table\\_size\(\)](#), [dwarf\\_set\\_frame\\_cfa\\_value\(\)](#), [dwarf\\_set\\_frame\\_same\\_value\(\)](#), or [dwarf\\_set\\_frame\\_undefined\\_value\(\)](#) with an input `dw_value` of zero (0) tell the function to ignore the input `dw_value` argument and return the recorded value/size.

### Changes 2.1.0 to 2.2.0

Released 10 October 2025

Added functions [dwarf\\_lvn\\_name\\_direct\(\)](#) [dwarf\\_lvn\\_name\(\)](#) [dwarf\\_lvn\\_table\\_entry\(\)](#) enabling access to all the fields relevant in DWARF6 `DW_AT_language_version` attributes.

In builds using (for example) `cc -std=c99 gcc` will turn off visibility of `strdup()` in `string.h` leading to a build failure. So now we define `_GNU_SOURCE` in builds.

Corrected a bug in reading line table data that used `DW_FORM_strx` (and other `strx` forms).

Fixed various failures to handle corrupted (fuzzed) Apple Mach-o object files.

### Changes 2.0.0 to 2.1.0

Released 20 July 2025

Corrected (and tested) use of DWARF6 attributes `DW_AT_language_name` and `DW_AT_language_version`. As of July 2025 we are not aware of a released compiler providing these attributes.

Added function [dwarf\\_srclangname\(\)](#) so that `DW_AT_language_name` attribute values can be accessed. Added [dwarf\\_language\\_version\\_data\(\)](#) because [dwarf\\_language\\_version\\_string\(\)](#) is not an appropriate function name here. The old name still exists and works.

Added [dwarf\\_srclangname\\_version\(\)](#) so that the data provided in DWARF6 `DW_AT_language_version` can be returned.

Fixed minor warnings from a compiler (`dwarfgn`) and from `meson`. No change to output.

Removed heuristic checks for decompress reasonableness as such proved to be ... unreasonable in certain real object files..

Corrected the cmake build of shared-library libdwarf/CMakeLists.txt

Given an unusual object using debuglink but with no sections with names starting with `.debug_` or `_eh_frame`, libdwarf would complain about not having any DWARF sections and ignore the debuglink data. See github issue 297 for details of the fix.

### Changes 0.12.0 to 2.0.0

Released 20 May 2025.

Skipping all versions 1.x.x because before libdwarf used Semantic Versioning gcc built libdwarf.so.1.0.0 .

Fixed a longstanding bug in `configure.ac` which began to cause builds to fail with recent `autoconf`.

Fixed a problem in `test/CmakeLists.txt` that caused current builds to fail on Msys2 Mingw64. Had been working for many months.

Updated the error report (for `zlib`, `zstd`) when decompression exceeds a heuristic. Now reports the compressed-len and the uncompressed-len. Increased the heuristic multiple allowed from 16 to 32.

### Changes 0.11.1 to 0.12.0

Released 02 April 2025

To optionally support `mmap/munmap` of object files sections we read we have added a function prototype for struct [Dwarf\\_Obj\\_Access\\_Methods\\_a\\_s](#) function `om_load_section()`. This will help when reading multi gigabyte object files. And we added a function prototype for destructing the object specific data while removing library internal public functions.

If an application does not call any of the functions which are new in v0.12.0 then it will work without recompilation.

Any application calling the new functions (for example, v0.12.0 `dwarfdump`) will only work with a v0.12.0 libdwarf.

If one is calling [dwarf\\_object\\_init\\_b\(\)](#) (almost no one ever calls this function) one is therefore instantiating struct [Dwarf\\_Obj\\_Access\\_Methods\\_a\\_s](#) oneself, you will surely find that your application will not work with libdwarf 0.12.0. Moreover, recompilation will fail unless you update your source to add the two new pointers to your instantiation (typically just add two zeros or NULLs in that struct instance).

Added new API function [dwarf\\_machine\\_architecture\\_a\(\)](#) which has an additional argument added to let `dwarfdump` create an better `.text` (etc) address-range for the object file being read for improved checking (fewer incorrect error reports) in `dwarfdump -k` output.

Up through December 2024 libdwarf could be made to be very very slow (Denial of Service) with calls with thousands of duplicate attributes in an abbreviation list of a specially constructed Compilation Unit.

Beginning 2025 by default that cannot happen as the library quickly notices and returns `DW_DLV_ERROR` with error details noted. Callers should check the return value and act appropriately, as always, when calling the library.

In case one has (and cannot fix) object files with duplicated attributes one can call a new API function↵: [dwarf\\_library\\_allow\\_dup\\_attr\(\)](#). The library defaults to false (0) meaning the checks are done in libdwarf by default. Pass non-zero value to allow duplicate attributes in a Debugging Information Entry through to callers.

Added the ability to select, at runtime, whether libdwarf will use `malloc` to load section content from an object file being read (previously the only option) or will use `mmap` instead.

If the build determines `mmap` is unavailable then `malloc` will be used.

Added API function [dwarf\\_set\\_load\\_preference\(\)](#) giving callers the option to choose the default section load functions. libdwarf now recognizes the environment variable `DWARF_WHICH_ALLOC` to select whether the library

uses `mmap` or `malloc/read` to load object section data, and the environment variable values `'DWARF_WHICH_ALLOC=mmap'` or `'DWARF_WHICH_ALLOC=malloc'` are the only values recognized. A recognized environment variable overrides `dwarf_set_load_preference()` values. If the `libdwarf` build determines `mmap` is unavailable then only `malloc` will be used.

Added API function `dwarf_get_mmap_count()` giving callers the ability to determine what section loads were used and the total amount of section data loaded.

Added API function `dwarf_get_LANGUAGE_name()` to be able to easily get a string for `DW_LNAME_Ada` etc.

Added API function `dwarf_language_version_string()`. This returns information defined by DWARF 6 and useful in interpreting DWARF6 language-version strings based on a name accessed from `DW_AT_language_name` attribute.

### Changes 0.11.0 to 0.11.1

Corrected handling of DWARF5 `.debug_rnglists` and `.debug_loclists`. No API change, no incompatibilities.

### Changes 0.10.1 to 0.11.0

Added function `dwarf_get_ranges_baseaddress()` to the api to allow `dwarfdump` and other library callers to easily derive the (cooked) address from the raw data in the DWARF2, DWARF3, DWARF4 `.debug_ranges` section. An example of use is in [doc/checkexamples.c](#) (see `examplev`).

### Changes 0.9.2 to 0.10.1

Released 01 July 2024 (Release 0.10.0 was missing a `CMakeLists.txt` file and is withdrawn).

Added API function `dwarf_get_locdesc_entry_e()` to allow `dwarfdump` to report some data from `.debug_loclists` more completely – it reports a byte length of each `loclist` item. This is of little interest to anyone, surely. `dwarf_get_locdesc_entry_d()` is still what you should be using.

`dwarf_debug_addr_table()` now supports reading the DWARF4 GNU extension `.debug_addr` table.

A heuristic sanity check for PE object files was too conservative in limiting `VirtualSize` to 200MB. A library user has an exe with `.debug_info` size of over 200MB. Increased the limit to be 2000MB and changed the names of the errors for the three heuristic checks to include *HEURISTIC* so it is easier to know the kind of error/failure it is.

When doing a shared-library build with `cmake` we were not emitting the correct `.so` version names nor setting `SONAME` with the correct version name. This long-standing mistake is now fixed.

### Changes 0.9.1 to 0.9.2

Version 0.9.2 released 2 April 2024

Vulnerabilities DW202402-001, DW202402-002, DW202402-003, and DW202403-001 could crash *libdwarf* given a carefully corrupted (fuzzed) DWARF object file. Now the library returns an error for these corruptions. `DW_CFA_high_user` (in [dwarf.h](#)) was a misspelling. Added the correct spelling `DW_CFA_hi_user` and a comment on the incorrect spelling.

### Changes 0.9.0 to 0.9.1

Version 0.9.1 released 27 January 2024

The abbreviation code type returned by `dwarf_die_abbrev_code()` changed from `int` to **Dwarf\_Unsigned** as abbrev codes are not constrained by the DWARF Standard.

The section count returned by `dwarf_get_section_count()` is now of type **Dwarf\_Unsigned**. The previous type of `int` never made sense in *libdwarf*. Callers will, in practice, see the same value as before.

All type-warnings issued by MSVC have been fixed.

Problems reading Macho (Apple) relocatable object files have been fixed.

Each of the build systems available now has an option which eliminates *libdwarf* references to the object section decompression libraries. See the respective READMEs.

### Changes 0.8.0 to 0.9.0

Version 0.9.0 released 8 December 2023

Adding functions (rarely needed) for callers with special requirements. Added [dwarf\\_get\\_section\\_info\\_by\\_name\\_a\(\)](#) and [dwarf\\_get\\_section\\_info\\_by\\_index\\_a\(\)](#) which add `dw_section_flags` pointer argument to return the object section file flags (whose meaning depends entirely on the object file format), and `dw_section_offset` pointer argument to return the object-relevant offset of the section (here too the meaning depends on the object format). Also added [dwarf\\_machine\\_architecture\(\)](#) which returns a few top level data items about the object *libdwarf* has opened, including the 'machine' and 'flags' from object headers (all supported object types).

This adds new library functions [dwarf\\_next\\_cu\\_header\\_e\(\)](#) and [dwarf\\_siblingof\\_c\(\)](#). Used exactly as documented [dwarf\\_next\\_cu\\_header\\_d\(\)](#) and [dwarf\\_siblingof\\_b\(\)](#) work fine and continue to be supported for the foreseeable future. However it would be easy to misuse as the requirement that [dwarf\\_siblingof\\_b\(\)](#) be called immediately after a successful call to [dwarf\\_next\\_cu\\_header\\_d\(\)](#) was never stated and that dependency was impossible to enforce. The dependency was an API mistake made in 1992.

So [dwarf\\_next\\_cu\\_header\\_e\(\)](#) now returns the compilation-unit DIE as well as header data and [dwarf\\_siblingof\\_c\(\)](#) is not needed except to traverse sibling DIEs. (the compilation-unit DIE by definition has no siblings).

Changes were required to support Mach-O (Apple) universal binaries, which were not readable by earlier versions of the library.

We have new library functions [dwarf\\_init\\_path\\_a\(\)](#), [dwarf\\_init\\_path\\_dl\\_a\(\)](#), and [dwarf\\_get\\_universalbinary\\_count\(\)](#).

The first two allow a caller to specify which (numbering from zero) object file to report on by adding a new argument `dw_universalnumber`. Passing zero as the `dw_universalnumber` argument is always safe.

The third lets callers retrieve the number being used.

These new calls do not replace anything so existing code will work fine.

Applying the previously existing calls [dwarf\\_init\\_path\(\)](#) [dwarf\\_init\\_path\\_dl\(\)](#) to a Mach-O universal binary works, but the library will return data on the first (index zero) as a default since there is no `dw_universalnumber` argument possible.

For improved performance in reading Fde data when iterating though all usable pc values we add [dwarf\\_get\\_fde\\_info\\_for\\_all\\_regs3\\_b\(\)](#), which returns the next pc value with actual frame data. We retain [dwarf\\_get\\_fde\\_info\\_for\\_all\\_regs3\(\)](#) so existing code need not change.

### Changes 0.7.0 to 0.8.0

v0.8.0 released 2023-09-20

New functions [dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_c\(\)](#), [dwarf\\_get\\_fde\\_info\\_for\\_cfa\\_reg3\\_c\(\)](#) are defined. The advantage of the new versions is they correctly type the `dw_offset` argument return value as `Dwarf_Signed` instead of the earlier and incorrect type `Dwarf_Unsigned`.

The original functions [dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_b\(\)](#) and [dwarf\\_get\\_fde\\_info\\_for\\_cfa\\_reg3\\_b\(\)](#) continue to exist and work for compatibility with the previous release.

For all `open()` calls for which the `O_CLOEXEC` flag exists we now add that flag to the `open()` call.

Vulnerabilities involving reading corrupt object files (created by fuzzing) have been fixed: DW202308-001 (ossfuzz 59576), DW202307-001 (ossfuzz 60506), DW202306-011 (ossfuzz 59950), DW202306-009 (ossfuzz 59755), DW202306-006 (ossfuzz 59727), DW202306-005 (ossfuzz 59717), DW202306-004 (ossfuzz 59695), DW202306-002 (ossfuzz 59519), DW202306-001 (ossfuzz 59597), DW202305-010 (ossfuzz 59478), DW202305-009 (ossfuzz 56451), DW202305-008 (ossfuzz 56451), DW202305-007 (ossfuzz 56474), DW202305-006 (ossfuzz 56472), DW202305-005 (ossfuzz 56462), DW202305-004 (ossfuzz 56446).

### Changes 0.6.0 to 0.7.0

v0.7.0 released 2023-05-20

Elf section counts can exceed 16 bits (on linux see **man 5 elf**) so some function prototype members of struct [Dwarf\\_Obj\\_Access\\_Methods\\_a\\_s](#) changed. Specifically, `om_get_section_info()`, `om_load_section()`, and `om_relocate_a_section()` now pass section indexes as `Dwarf_Unsigned` instead of `Dwarf_Half`. Without this change executables/objects with more than 64K sections cannot be read by *libdwarf*. This is unlikely to affect your code since for most users *libdwarf* takes care of this and `dwarfdump` is aware of this change.

Two functions have been removed from [libdwarf.h](#) and the library: `dwarf_dnames_abbrev_by_code()` and `dwarf_dnames_abbrev_form_by_index()`.

`dwarf_dnames_abbrev_by_code()` is slow and pointless. Use either [dwarf\\_dnames\\_name\(\)](#) or [dwarf\\_dnames\\_abbrevtable\(\)](#) instead, depending on what you want to accomplish.

`dwarf_dnames_abbrev_form_by_index()` is not needed, was difficult to call due to argument list requirements, and never worked.

### Changes 0.5.0 to 0.6.0

v0.6.0 released 2023-02-20 The `dealloc` required by [dwarf\\_offset\\_list\(\)](#) was wrong. The call could crash *libdwarf* on systems with 32bit pointers. The new and proper `dealloc` (for all pointer sizes) is `dwarf_dealloc(dbg, offsetlistptr, DW_DLA_UARRAY)`;

A memory leak from [dwarf\\_load\\_loclists\(\)](#) and [dwarf\\_load\\_rnglists\(\)](#) is fixed and the *libdwarf*-regressiontests error that hid the leak has also been fixed.

A **compatibility** change affects callers of [dwarf\\_dietype\\_offset\(\)](#), which on success returns the offset of the target of the `DW_AT_type` attribute (if such exists in the `Dwarf_Die`). Added a pointer argument so the function can (when appropriate) return a `FALSE` argument indicating the offset refers to DWARF4 `.debug_types` section, rather than `TRUE` value when `.debug_info` is the section the offset refers to. If anyone was using this function it would fail badly (while pretending success) with a DWARF4 `DW_FORM_ref_sig8` on a `DW_AT_type` attribute from the `Dwarf_Die` argument. One will likely encounter DWARF4 content so a single correct function seemed necessary. New regression tests will ensure this will continue to work.

A **compatibility** change affects callers of [dwarf\\_get\\_pubtypes\(\)](#). If an application reads `.debug_pubtypes` there is a **compatibility break**. Such applications must be recompiled with latest *libdwarf*, change `Dwarf_Type` declarations to use `Dwarf_Global`, and can only use the latest *libdwarf*. We are correcting a 1993 library design mistake that created extra work and documentation for library users and inflated the *libdwarf* API and documentation for no good reason.

The changes are: the data type `Dwarf_Type` disappears as do `dwarf_pubtypename()`, `dwarf_pubtype_die_offset()`, `dwarf_pubtype_cu_offset()`, `dwarf_pubtype_name_offsets()` and `dwarf_pubtypes_dealloc()`. Instead the type is `Dwarf_Global`, the type and functions used for [dwarf\\_get\\_globals\(\)](#). The existing read/dealloc functions for `Dwarf_Global` apply to `pubtypes` data too.

No one should be referring to the 1990s SGI/IRIX sections `.debug_weaknames`, `.debug_funcnames`, `.debug_varnames`, or `.debug_typenames` as they are not emitted by any compiler except from SGI/IRIX/MIPS in that period. There is (revised) support in *libdwarf* to read these sections, but we will not mention details here.

Any use of DW\_FORM\_strx3 or DW\_FORM\_addrx3 in DWARF would, in 0.5.0 and earlier, result in *libdwarf* reporting erroneous data. A copy-paste error in *libdwarf/dwarf\_util.c* was noticed and fixed 24 January 2023 for 0.6.0. Bug **DW202301-001**.

### Changes 0.4.2 to 0.5.0

v0.5.0 released 2022-11-22 The handling of the `.debug_abbrev` data in *libdwarf* is now more cpu-efficient (measurably faster) so access to DIEs and attribute lists is faster. The changes are library-internal so are not visible in the API.

Corrects CU and TU indexes in the `.debug_names` (fast access) section to be zero-based. The code for that section was previously unusable as it did not follow the DWARF5 documentation.

`dwarf_get_globals()` now returns a list of Dwarf\_Global names and DIE offsets whether such are defined in the `.debug_names` or `.debug_pubnames` section or both. Previously it only read `.debug_pubnames`.

A new function, `dwarf_global_tag_number()`, returns the DW\_TAG of any Dwarf\_Global that was derived from the `.debug_names` section.

Three new functions enable printing of the `.debug_addr` table. `dwarf_debug_addr_table()`, `dwarf_debug_addr_by_index()`, and `dwarf_dealloc_debug_addr_table()`. Actual use of the table(s) in `.debug_addr` is handled for you when an attribute invoking such is encountered (see DW\_FORM\_addrx, DW\_FORM\_addrx1 etc).

Added doc/libdwarf.dox to the distribution (left out by accident earlier).

### Changes 0.4.1 to 0.4.2

0.4.2 released 2022-09-13. No API changes. No API additions. Corrected a bug in `dwarf_tsearchhash.c` where a delete request was accidentally assumed in all hash tree searches. It was invisible to *libdwarf* uses. Vulnerabilities DW202207-001 and DW202208-001 were fixed so error conditions when reading fuzzed object files can no longer crash *libdwarf* (the crash was possible but not certain before the fixes). In this release we believe neither *libdwarf* nor *dwarfdump* leak memory even when there are malloc failures. Any GNU debuglink or build-id section contents were not being properly freed (if malloced, meaning a compressed section) until 9 September 2022.

It is now possible to run the build sanity tests in all three build mechanisms (configure,cmake,meson) on linux, MacOS, FreeBSD, and Mingw msys2 (windows). *libdwarf* README.md (or README) and README.cmake document how to do builds for each supported platform and build mechanism.

### Changes 0.4.0 to 0.4.1

Reading a carefully corrupted DIE with form DW\_FORM\_ref\_sig8 could result in reading memory outside any section, possibly leading to a segmentation violation or other crash. Fixed.

See also

<https://www.prevanders.net/dwarfbug.xml> DW202206-001

Reading a carefully corrupted `.debug_pubnames/.debug_pubtypes` could lead to reading memory outside the section being read, possibly leading to a segmentation violation or other crash. Fixed.

See also

<https://www.prevanders.net/dwarfbug.xml> DW202205-001

*libdwf* accepts DW\_AT\_entry\_pc in a compilation unit DIE as a base address for location lists (though it will prefer DW\_AT\_low\_pc if present, per DWARF3). A particular compiler emits DW\_AT\_entry\_pc in a DWARF2 object, requiring this change.

*libdwf* adds `dwarf_suppress_debuglink_crc()` so that library callers can suppress crc calculations. (useful to save the time of crc when building and testing the same thing(s) over and over; it just loses a little checking.) Additionally, *libdwf* now properly handles objects with only GNU debug-id or only GNU debuglink.

`dwarfdump` adds `--show-args`, an option to print its arguments and version. Without that new option the version and arguments are not shown. The output of `-v` (`--version`) is a little more complete.

`dwarfdump` adds `--suppress-debuglink-crc`, an option to avoid crc calculations when rebuilding and rerunning tests depending on GNU `.note.gnu.buildid` or `.gnu_debuglink` sections. The help text and the `dwarfdump.1` man page are more specific documenting `--suppress-debuglink-crc` and `--no-follow-debuglink`

### Changes 0.3.4 to 0.4.0

Removed the unused `Dwarf_Error` argument from `dwarf_return_empty_pubnames()` as the function can only return DW\_DLV\_OK. `dwarf_xu_header_free()` renamed to `dwarf_dealloc_xu_header()`. `dwarf_gdbindex_free()` renamed to `dwarf_dealloc_gdbindex()`. `dwarf_loc_head_c_dealloc` renamed to `dwarf_dealloc_loc_head_c()`.

`dwarf_get_location_op_value_d()` renamed to `dwarf_get_location_op_value_c()`, and 3 pointless arguments removed. The `dwarf_get_location_op_value_d` version and the three arguments were added for DWARF5 in *libdwf*-20210528 but the change was a mistake. Now reverted to the previous version.

The `.debug_names` section interfaces have changed. Added `dwarf_dnames_offsets()` to provide details of facts useful in problems reading the section. `dwarf_dnames_name()` now does work and the interface was changed to make it easier to use.

### Changes 0.3.3 to 0.3.4

Replaced the groff -mm based *libdwf.pdf* with a *libdwf.pdf* generated by doxygen and latex.

Added support for the meson build system.

Updated an include in *libdwf* source files. Improved doxygen documentation of *libdwf*. Now 'make check -j8' and the like works correctly. Fixed a bug where reading a PE (Windows) object could fail for certain section virtual size values. Added initializers to two uninitialized local variables in *dwarfdump* source so a compiler warning cannot not kill a `--enable-wall` build.

Added `src/bin/dwarfexample/showsectiongroups.c` so it is easy to see what groups are present in an object without all the other *dwarfdump* output.

### Changes 20210528 to 0.3.3 (28 January 2022)

There were major revisions in going from date versioning to Semantic Versioning. Many functions were deleted and various functions changed their list of arguments. Many many filenames changed. Include lists were simplified. Far too much changed to list here.

## Chapter 2

# JIT and special case DWARF

html 2

### 2.1 Reading DWARF not in an object file

If the DWARF you work with is in standard object files (Elf, PE, MacOS) then you can ignore this section entirely. All that this section describes is used, but it's already done for you in functions in the library:

See also

[dwarf\\_init\\_path](#) [dwarf\\_init\\_path\\_dl](#)  
[dwarf\\_init\\_b](#) and  
[dwarf\\_finish](#) .

This section describes how to use calls

See also

[dwarf\\_object\\_init\\_b](#)  
[dwarf\\_object\\_finish](#) .

These functions are useful if someone is doing just-in-time compilation, and someone working on the code wants to debug this on-the-fly code in a situation where nothing can be written to disc, but DWARF can be constructed in memory.

For a simple example of this with DWARF in local arrays

See also

[Demonstrating reading DWARF without a file.](#)

But the *libdwarf* feature can be useful in a variety of circumstances.

For example, the DWARF data were kept in simple files of bytes on the internet. Or on the local net. Or if files can be written locally each section could be kept in a simple stream of bytes in the local file system.

Another example is a non-standard file system, or file format, with the intent of obfuscating the file or the DWARF.

For this to work the code generator must generate standard DWARF.

Overall the idea is a simple one: You write a small handful of functions and supply function pointers and code implementing the functions. These are part of your application or library, not part of *libdwarf*. Your code accesses the data in whatever way applies and you write code that provides the interfaces so standard *libdwarf* can access your DWARF content.

You set up a little bit of data with that code (described below) and then you have essentially written the dwarf\_↵ init\_path equivalent and you can access compilation units, line tables etc and the standard *libdwarf* function calls simply work.

Data you need to create involves the following types. What follows describes how to fill them in and how to make them work for you.

```
typedef struct Dwarf_Obj_Access_Interface_a_s
    Dwarf_Obj_Access_Interface_a;
struct Dwarf_Obj_Access_Interface_a_s {
    void                *ai_object;
    const Dwarf_Obj_Access_Methods_a *ai_methods;
};

typedef struct Dwarf_Obj_Access_Methods_a_s
    Dwarf_Obj_Access_Methods_a
struct Dwarf_Obj_Access_Methods_a_s {
    int                (*om_get_section_info)(void* obj,
        Dwarf_Half      section_index,
        Dwarf_Obj_Access_Section_a* return_section,
        int              * error);
    Dwarf_Small        (*om_get_byte_order)(void* obj);
    Dwarf_Small        (*om_get_length_size)(void* obj);
    Dwarf_Small        (*om_get_pointer_size)(void* obj);
    Dwarf_Unsigned     (*om_get_filesize)(void* obj);
    Dwarf_Unsigned     (*om_get_section_count)(void* obj);
    int                (*om_load_section)(void* obj,
        Dwarf_Half      section_index,
        Dwarf_Small** return_data,
        int              * error);
    int                (*om_relocate_a_section)(void* obj,
        Dwarf_Half      section_index,
        Dwarf_Debug      dbg,
        int              *error);
};

typedef struct Dwarf_Obj_Access_Section_a_s
    Dwarf_Obj_Access_Section_a
struct Dwarf_Obj_Access_Section_a_s {
    const char*        as_name;
    Dwarf_Unsigned     as_type;
    Dwarf_Unsigned     as_flags;
    Dwarf_Addr         as_addr;
    Dwarf_Unsigned     as_offset;
    Dwarf_Unsigned     as_size;
    Dwarf_Unsigned     as_link;
    Dwarf_Unsigned     as_info;
    Dwarf_Unsigned     as_addralign;
    Dwarf_Unsigned     as_entrysize;
};
```

### 2.1.1 Describing the Interface

**struct** struct Dwarf\_Obj\_Access\_Interface\_a\_s

Your code must create and fill in this struct's two pointer members. Libdwarf needs these to access your DWARF data. You pass a pointer to this filled-in struct to **dwarf\_object\_init\_b**. When it is time to conclude all access to the created Dwarf\_Debug call **dwarf\_object\_finish**. Any allocations you made in setting these things up you must then free after calling **dwarf\_object\_finish**.

#### ai\_object

Allocate a local struct (*libdwarf* will not touch this struct and will not know anything of its contents). You will need one of these for each Dwarf\_Debug you open. Put a pointer to this into **ai\_object**. Then fill in all the data you need to access information you will pass back via the **ai\_methods** functions. In the description of the methods functions described later here, this pointer is named **obj**.

#### ai\_methods

Usually you allocate a static structure and fill it in with function pointers (to functions you write). Then put a pointer to the static structure into this field.

### 2.1.2 Describing A Section

#### Dwarf\_Obj\_Access\_Section\_a:

The set of fields here is a set that is sufficient to describe a single object section to *libdwarf*. Your implementation of a **om\_get\_section\_info** must simply fill in a few fields (leaving most zero) for *libdwarf* for the section indexed. The fields here are standard Elf, and for most you can just fill in the value zero. For section index zero **as\_name** should be set to an empty string (see below about section index numbers).

**as\_name:** Here you set a section name via the pointer. The section names must be names as defined in the DWARF standard, so if such do not appear in your data you have to create the strings yourself.

**as\_type:** Just fill in zero.

**as\_flags:** Just fill in zero.

**as\_addr:** Fill in the address, in local memory, where the bytes of the section are.

**as\_offset:** Just fill in zero.

**as\_size:** Fill in the size, in bytes, of the section you are telling *libdwarf* about.

**as\_link:** Just fill in zero.

**as\_info:** Just fill in zero.

**as\_addralign:** Just fill in zero.

**as\_entrysize:** Just fill in one.

### 2.1.3 Function Pointers

**struct Dwarf\_Obj\_Access\_Methods\_a\_s:**

The functions *libdwarf* needs to access object data are declared here. Usually the struct is statically defined and the function pointers are set at compile time. You must implement these functions based on your knowledge of how the actual data is represented and where to get it.

Each has a first-parameter of **obj** which is a struct you define to hold data you need to implement this set of functions. You refer to it When *libdwarf* calls your set of functions (these described now) it passes the *ai\_object* pointer you provided to these functions as **obj** parameter .

This is the final part of your work for *libdwarf*. In the source file with your code you will be allocating data, making a provision for an array (real or conceptual) for per-section data, and returning values *libdwarf* needs. Note that the section array should include an index zero with all zero field values. That means interesting fields start with index one. This special case of index zero Elf is required and matches the standard Elf object format.

Notice that the **error** argument, where applicable, is an `int*` . Error codes passed back are DW\_DLE codes and **dwarf\_errmsg\_by\_number** may be used (by your code) to get the standard error string for that error.

#### om\_get\_section\_info

Get address, size, and name info about a section.

```
Parameters
obj          - Your data
section_index - Zero-based index.
return_section - Pointer to a structure in which
                section info will be placed.  Caller must
                provide a valid pointer to a structure area.
                The structure's contents will be overwritten
                by the call to get_section_info.
error        - A pointer to an integer in which an error
                code may be stored.

Return
DW_DLV_OK      - Everything ok.
DW_DLV_ERROR   - Error occurred. Use 'error' to determine the
                @e libdwarf defined error.
DW_DLV_NO_ENTRY - No such section.
```

#### om\_get\_byte\_order

This retrieves data you put into your **ai\_object** struct that you filled out.

Get from your @b *ai\_object* whether the object file represented by this *interface* is big-endian (DW\_END\_big) or little endian (DW\_END\_little).

```
Parameters
obj - Your data

Return
Endianness of object, DW_END_big or DW_END_little.
```

#### om\_get\_length\_size

This retrieves data you put into your **ai\_object** struct that you filled out.

Get the size of a length field in the underlying object file.  
@e *libdwarf* currently supports \* 4 and 8 byte sizes, but may support larger in the future.  
Perhaps the *return* type should be an enumeration?

```
Parameters
obj - Your data

Return
Size of length. Cannot fail.
```

#### om\_get\_pointer\_size

This retrieves data you put into your **ai\_object** struct that you filled out.

Get the size of a pointer field in the underlying object file.

@e libdwarf currently supports 4 and 8 byte sizes.  
Perhaps the `return` type should be an enumeration?

Return  
Size of pointer. Cannot fail. \*/

### om\_get\_filesize

This retrieves data you put into your `ai_object` struct that you filled out.

Parameters  
obj - Your data

Return  
Must `return` a value at least as large as any section @e libdwarf might read. Returns a value that is a sanity check on offsets @e libdwarf reads `for this` DWARF set. It need not be a tight bound.

### om\_get\_section\_count

This retrieves data you put into your `ai_object` struct that you filled out.

Get the number of sections in the `object` file, including the index zero section with no content.

Parameters  
obj - Your data

Return  
Number of sections.

### om\_load\_section

This retrieves data you put into your `ai_object` struct that you filled out.

Get a pointer to an array of bytes that are the section content.

Get a pointer to an array of bytes that represent the section.

Parameters  
obj - Your data  
section\_index - Zero-based section index.  
return\_data - Place the address of `this` section content into `*return_data`.  
error - Pointer to an integer `for` returning libdwarf-defined error numbers.

Return  
DW\_DLV\_OK - No error.  
DW\_DLV\_ERROR - Error. Use 'error' to indicate a libdwarf-defined error number.  
DW\_DLV\_NO\_ENTRY - No such section. \*/

### om\_relocate\_a\_section

Leave `this` pointer NULL.  
If relocations are required it is probably simpler `for` you `do` to them yourself in your implementation of @b `om_load_section`.  
Any relocations `this` function pointer is to use must be in standard Elf relocation (32 or 64 bit) form and must be in an appropriately named Elf relocation section.

Parameters  
obj - Your data  
section\_index - Zero-based index of the section to be relocated.  
error - Pointer to an integer `for` returning libdwarf-defined error numbers.

Return  
DW\_DLV\_OK - No error.  
DW\_DLV\_ERROR - Error. Use 'error' to indicate a libdwarf-defined error number.  
DW\_DLV\_NO\_ENTRY - No such section.

## Chapter 3

# dwarf.h

[dwarf.h](#) contains all the identifiers such as `DW_TAG_compile_unit` etc from the various versions of the DWARF Standard beginning with DWARF2 and containing all later Dwarf Standard identifiers.

In addition, it contains all user-defined identifiers that we have been able to find.

All identifiers here are C defines with the prefix `"DW_"`.

## Chapter 4

# libdwarf.h

[libdwarf.h](#) contains all the type declarations and function declarations needed to use the library. It is essential that coders include [dwarf.h](#) before including [libdwarf.h](#).

All identifiers here in the public namespace begin with DW\_ or Dwarf\_ or dwarf\_ . All function argument names declared here begin with dw\_ .

## Chapter 5

# checkexamples.c

[checkexamples.c](#) contains what user code should be. Hence the code typed in [checkexamples.c](#) is PUBLIC DOMAIN and may be copied, used, and altered without any restrictions.

[checkexamples.c](#) need not be compiled routinely nor should it ever be executed.

To verify syntatic correctness compile in the libdwarf-code/doc directory with:

```
cc -c -Wall -O0 -Wpointer-arith \
-Wdeclaration-after-statement \
-Wextra -Wcomment -Wformat -Wpedantic -Wuninitialized \
-Wno-long-long -Wshadow -Wbad-function-cast \
-Wmissing-parameter-type -Wnested-externs \
-I../src/lib/libdwarf checkexamples.c
```

# Chapter 6

## Topic Index

### 6.1 Topics

Here is a list of all topics with brief descriptions:

Basic Library Datatypes Group . . . . .	41
Enumerators with various purposes . . . . .	42
Defined and Opaque Structs . . . . .	43
Default stack frame macros . . . . .	52
DW_DLA alloc/dealloc typename&number . . . . .	53
DW_DLE Dwarf_Error numbers . . . . .	54
Libdwarf Initialization Functions . . . . .	64
Compilation Unit (CU) Access . . . . .	71
Debugging Information Entry (DIE) content . . . . .	78
DIE Attribute and Attribute-Form Details . . . . .	97
Line Table For a CU . . . . .	112
Ranges: code addresses in DWARF3-4 . . . . .	128
Rnglists: code addresses in DWARF5 . . . . .	130
Locations of data: DWARF2-DWARF5 . . . . .	135
.debug_addr access: DWARF5 . . . . .	143
Macro Access: DWARF5 . . . . .	146
Macro Access: DWARF2-4 . . . . .	153
Stack Frame Access . . . . .	154
Abbreviations Section Details . . . . .	173
String Section .debug_str Details . . . . .	177
Str_Offsets section details . . . . .	178
Dwarf_Error Functions . . . . .	181
Generic dwarf_dealloc Function . . . . .	183
Access to Section .debug_sup . . . . .	184
Fast Access to .debug_names DWARF5 . . . . .	185
Fast Access to a CU given a code address . . . . .	192
Fast Access to .debug_pubnames and more. . . . .	195
Fast Access to GNU .debug_gnu_pubnames . . . . .	202
Fast Access to Gdb Index . . . . .	206
Fast Access to Split Dwarf (Debug Fission) . . . . .	214
Access GNU .gnu_debuglink, build-id. . . . .	220
Harmless Error recording . . . . .	224
Names DW_TAG_member etc as strings . . . . .	227
Object Sections Data . . . . .	231
Section Groups Objectfile Data . . . . .	240

LEB Encode and Decode . . . . .	242
Miscellaneous Functions . . . . .	243
Determine Object Type of a File . . . . .	247
Section allocation: malloc or mmap . . . . .	248
Using dwarf_init_path() . . . . .	249
Using dwarf_init_path_dl() . . . . .	250
Using dwarf_attrlist() . . . . .	251
Attaching a tied dbg . . . . .	252
Detaching a tied dbg . . . . .	253
Examining Section Group data . . . . .	253
Using dwarf_siblingof_c() . . . . .	254
Using dwarf_siblingof_b() . . . . .	254
Using dwarf_child() . . . . .	255
using dwarf_validate_die_sibling . . . . .	255
Example walking CUs(e) . . . . .	257
Example walking CUs(d) . . . . .	258
Using dwarf_offdie_b() . . . . .	260
Using dwarf_offset_given_die() . . . . .	261
Using dwarf_attrlist() . . . . .	261
Using dwarf_offset_list() . . . . .	261
Documenting Form_Block . . . . .	262
Using dwarf_discr_list() . . . . .	263
Location/expression access . . . . .	264
Reading a location expression . . . . .	266
Using dwarf_srclines_b() . . . . .	267
Using dwarf_srclines_b() and linecontext . . . . .	269
Using dwarf_srcfiles() . . . . .	269
Using dwarf_get_globals() . . . . .	270
Using dwarf_globals_by_type() . . . . .	271
Reading .debug_weaknames (nonstandard) . . . . .	271
Reading .debug_funcnames (nonstandard) . . . . .	271
Reading .debug_types (nonstandard) . . . . .	272
Reading .debug_varnames data (nonstandard) . . . . .	272
Reading .debug_names data . . . . .	273
Reading .debug_macro data (DWARF5) . . . . .	275
Reading .debug_macinfo (DWARF2-4) . . . . .	278
Extracting fde, cie lists. . . . .	278
Reading the .eh_frame section . . . . .	279
Using dwarf_expand_frame_instructions . . . . .	279
Reading string offsets section data . . . . .	280
Reading an aranges section . . . . .	281
Example getting .debug_ranges data . . . . .	282
Reading gdbindex data . . . . .	284
Reading gdbindex addressarea . . . . .	285
Reading the gdbindex symbol table . . . . .	285
Reading cu and tu Debug Fission data . . . . .	286
Reading Split Dwarf (Debug Fission) hash slots . . . . .	287
Reading high pc from a DIE. . . . .	287
Reading Split Dwarf (Debug Fission) data . . . . .	288
Retrieving tag,attribute,etc names . . . . .	288
Using GNU debuglink data . . . . .	289
Accessing accessing raw rnglist . . . . .	290
Accessing rnglists section . . . . .	291
Demonstrating reading DWARF without a file. . . . .	292
A simple report on section groups. . . . .	297

# Chapter 7

## Class Index

### 7.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">Dwarf_Block_s</a>	301
<a href="#">Dwarf_Cmdline_Options_s</a>	301
<a href="#">Dwarf_Debug_Fission_Per_CU_s</a>	302
<a href="#">Dwarf_Form_Data16_s</a>	302
<a href="#">Dwarf_Macro_Details_s</a>	302
<a href="#">Dwarf_Obj_Access_Interface_a_s</a>	303
<a href="#">Dwarf_Obj_Access_Methods_a_s</a>	303
<a href="#">Dwarf_Obj_Access_Section_a_s</a>	304
<a href="#">Dwarf_Printf_Callback_Info_s</a>	305
<a href="#">Dwarf_Ranges_s</a>	305
<a href="#">Dwarf_Regtable3_s</a>	306
<a href="#">Dwarf_Regtable_Entry3_s</a>	306
<a href="#">Dwarf_Sig8_s</a>	307

## Chapter 8

# File Index

### 8.1 File List

Here is a list of all documented files with brief descriptions:

<a href="#">checkexamples.c</a>	311
/home/davea/dwarf/code/src/bin/dwarfexample/ <a href="#">jitreader.c</a>	311
/home/davea/dwarf/code/src/bin/dwarfexample/ <a href="#">showsectiongroups.c</a>	311
/home/davea/dwarf/code/src/lib/libdwarf/ <a href="#">dwarf.h</a>	313
/home/davea/dwarf/code/src/lib/libdwarf/ <a href="#">libdwarf.h</a>	333

# Chapter 9

## Topic Documentation

### 9.1 Basic Library Datatypes Group

#### Typedefs

- typedef unsigned long long [Dwarf\\_Unsigned](#)
- typedef signed long long [Dwarf\\_Signed](#)
- typedef unsigned long long [Dwarf\\_Off](#)
- typedef unsigned long long [Dwarf\\_Addr](#)
- typedef int [Dwarf\\_Bool](#)
- typedef unsigned short [Dwarf\\_Half](#)
- typedef unsigned char [Dwarf\\_Small](#)
- typedef void \* [Dwarf\\_Ptr](#)

#### 9.1.1 Detailed Description

#### 9.1.2 Typedef Documentation

##### 9.1.2.1 Dwarf\_Addr

[Dwarf\\_Addr](#)

Used when a data item is a an address represented in DWARF. 64 bits. Must be as large as the largest object address size.

##### 9.1.2.2 Dwarf\_Bool

[Dwarf\\_Bool](#)

A TRUE(non-zero)/FALSE(zero) data item.

### 9.1.2.3 Dwarf\_Half

`Dwarf_Half`

Many libdwarf values (attribute codes, for example) are defined by the standard to be 16 bits, and this datatype reflects that (the type must be at least 16 bits wide).

### 9.1.2.4 Dwarf\_Off

`Dwarf_Off`

Used for offsets. It should be same size as Dwarf\_Unsigned.

### 9.1.2.5 Dwarf\_Ptr

`Dwarf_Ptr`

A generic pointer type. It uses void \* so it cannot be added-to or subtracted-from.

### 9.1.2.6 Dwarf\_Signed

`Dwarf_Signed`

The basic signed data type. Intended to be a signed 64bit value.

### 9.1.2.7 Dwarf\_Small

`Dwarf_Small`

Used for small unsigned integers and used as Dwarf\_Small\* for pointers and it supports pointer addition and subtraction conveniently.

### 9.1.2.8 Dwarf\_Unsigned

`Dwarf_Unsigned`

The basic unsigned data type. Intended to be an unsigned 64bit value.

## 9.2 Enumerators with various purposes

### Enumerations

- enum `Dwarf_Ranges_Entry_Type` { `DW_RANGES_ENTRY` , `DW_RANGES_ADDRESS_SELECTION` , `DW_RANGES_END` }
- enum `Dwarf_Form_Class` {  
`DW_FORM_CLASS_UNKNOWN` = 0 , `DW_FORM_CLASS_ADDRESS` = 1 , `DW_FORM_CLASS_BLOCK` = 2 , `DW_FORM_CLASS_CONSTANT` =3 ,  
`DW_FORM_CLASS_EXPRLOC` = 4 , `DW_FORM_CLASS_FLAG` = 5 , `DW_FORM_CLASS_LINEPTR` = 6 ,  
`DW_FORM_CLASS_LOCLISTPTR` =7 ,  
`DW_FORM_CLASS_MACPTR` = 8 , `DW_FORM_CLASS_RANGELISTPTR` =9 , `DW_FORM_CLASS_REFERENCE` =10 , `DW_FORM_CLASS_STRING` = 11 ,  
`DW_FORM_CLASS_FRAMEPTR` = 12 , `DW_FORM_CLASS_MACROPTR` = 13 , `DW_FORM_CLASS_ADDRPTR` = 14 , `DW_FORM_CLASS_LOCLIST` = 15 ,  
`DW_FORM_CLASS_LOCLISTSPTR` =16 , `DW_FORM_CLASS_RNGLIST` =17 , `DW_FORM_CLASS_RNGLISTSPTR` =18 , `DW_FORM_CLASS_STROFFSETSPTR` =19 }

### 9.2.1 Detailed Description

### 9.2.2 Enumeration Type Documentation

#### 9.2.2.1 Dwarf\_Form\_Class

```
enum Dwarf_Form_Class
```

The dwarf specification separates FORMs into different classes. To do the separation properly requires 4 pieces of data as of DWARF4 (thus the function arguments listed here). The DWARF4 specification class definition suffices to describe all DWARF versions. See section 7.5.4, Attribute Encodings. A return of DW\_FORM\_CLASS\_UNKNOWN means the library could not properly figure out what form-class it is.

DW\_FORM\_CLASS\_FRAMEPTR is MIPS/IRIX only, and refers to the DW\_AT\_MIPS\_fde attribute (a reference to the .debug\_frame section).

DWARF5: DW\_FORM\_CLASS\_LOCLISTSPTR is like DW\_FORM\_CLASS\_LOCLIST except that LOCLISTSPTR is always a section offset, never an index, and LOCLISTSPTR is only referenced by DW\_AT\_loclists\_base. Note DW\_FORM\_CLASS\_LOCLISTSPTR spelling to distinguish from DW\_FORM\_CLASS\_LOCLISTPTR.

DWARF5: DW\_FORM\_CLASS\_RNGLISTSPTR is like DW\_FORM\_CLASS\_RNGLIST except that RNGLISTSPTR is always a section offset, never an index. DW\_FORM\_CLASS\_RNGLISTSPTR is only referenced by DW\_AT\_↔rnglists\_base.

#### 9.2.2.2 Dwarf\_Ranges\_Entry\_Type

```
enum Dwarf_Ranges_Entry_Type
```

The dwr\_addr1/addr2 data is either pair of offsets of a base pc address (DW\_RANGES\_ENTRY) or a base pc address (dwr\_addr2 in DW\_RANGES\_ADDRESS\_SELECTION) or both are zero(end of list, DW\_RANGES\_END) or both non-zero but identical (means an empty range, DW\_RANGES\_ENTRY). These are for use with DWARF 2,3,4.

DW\_RANGES\_ADDRESS\_SELECTION should have been spelled DW\_RANGES\_BASE\_ADDRESS. but it is not worth changing as it is widely used.

The DW\_RANGES\_ENTRY values are raw pc offset data recorded in the section, not addresses.

See also

[Example getting .debug\\_ranges data](#)

Dwarf\_Ranges\* apply to DWARF2,3, and 4. Not to DWARF5 (the data is different and in a new DWARF5 section).

## 9.3 Defined and Opaque Structs

### Classes

- struct [Dwarf\\_Form\\_Data16\\_s](#)
- struct [Dwarf\\_Sig8\\_s](#)
- struct [Dwarf\\_Block\\_s](#)
- struct [Dwarf\\_Printf\\_Callback\\_Info\\_s](#)
- struct [Dwarf\\_Cmdline\\_Options\\_s](#)
- struct [Dwarf\\_Ranges\\_s](#)
- struct [Dwarf\\_Regtable\\_Entry3\\_s](#)
- struct [Dwarf\\_Regtable3\\_s](#)
- struct [Dwarf\\_Macro\\_Details\\_s](#)
- struct [Dwarf\\_Obj\\_Access\\_Section\\_a\\_s](#)
- struct [Dwarf\\_Obj\\_Access\\_Methods\\_a\\_s](#)
- struct [Dwarf\\_Obj\\_Access\\_Interface\\_a\\_s](#)
- struct [Dwarf\\_Debug\\_Fission\\_Per\\_CU\\_s](#)

## Typedefs

- typedef struct [Dwarf\\_Form\\_Data16\\_s](#) Dwarf\_Form\_Data16
- typedef struct [Dwarf\\_Sig8\\_s](#) Dwarf\_Sig8
- typedef struct [Dwarf\\_Block\\_s](#) Dwarf\_Block
- typedef struct Dwarf\_Locdesc\_c\_s \* [Dwarf\\_Locdesc\\_c](#)
- typedef struct Dwarf\_Loc\_Head\_c\_s \* [Dwarf\\_Loc\\_Head\\_c](#)
- typedef struct Dwarf\_Gnu\_Index\_Head\_s \* [Dwarf\\_Gnu\\_Index\\_Head](#)
- typedef struct Dwarf\_Dsc\_Head\_s \* [Dwarf\\_Dsc\\_Head](#)
- typedef struct Dwarf\_Frame\_Instr\_Head\_s \* [Dwarf\\_Frame\\_Instr\\_Head](#)
- typedef void(\* [dwarf\\_printf\\_callback\\_function\\_type](#)) (void \*dw\_user\_pointer, const char \*dw\_linecontent)
- typedef struct [Dwarf\\_Cmdline\\_Options\\_s](#) **Dwarf\_Cmdline\_Options**
- typedef struct Dwarf\_Str\_Offsets\_Table\_s \* [Dwarf\\_Str\\_Offsets\\_Table](#)
- typedef struct [Dwarf\\_Ranges\\_s](#) Dwarf\_Ranges
- typedef struct [Dwarf\\_Regtable\\_Entry3\\_s](#) Dwarf\_Regtable\_Entry3
- typedef struct [Dwarf\\_Regtable3\\_s](#) Dwarf\_Regtable3
- typedef struct Dwarf\_Error\_s \* [Dwarf\\_Error](#)
- typedef struct Dwarf\_Debug\_s \* [Dwarf\\_Debug](#)
- typedef struct Dwarf\_Section\_s \* [Dwarf\\_Section](#)
- typedef struct Dwarf\_Die\_s \* [Dwarf\\_Die](#)
- typedef struct Dwarf\_Debug\_Addr\_Table\_s \* [Dwarf\\_Debug\\_Addr\\_Table](#)
- typedef struct Dwarf\_Line\_s \* [Dwarf\\_Line](#)
- typedef struct Dwarf\_Global\_s \* [Dwarf\\_Global](#)

- typedef struct Dwarf\_Dnames\_Head\_s \* [Dwarf\\_Dnames\\_Head](#)
- typedef void(\* [Dwarf\\_Handler](#)) (Dwarf\_Error dw\_error, Dwarf\_Ptr dw\_errarg)
- typedef struct [Dwarf\\_Macro\\_Details\\_s](#) Dwarf\_Macro\_Details
- typedef struct [Dwarf\\_Debug\\_Fission\\_Per\\_CU\\_s](#) Dwarf\_Debug\_Fission\_Per\_CU
- typedef struct [Dwarf\\_Obj\\_Access\\_Interface\\_a\\_s](#) Dwarf\_Obj\_Access\_Interface\_a
- typedef struct [Dwarf\\_Obj\\_Access\\_Methods\\_a\\_s](#) Dwarf\_Obj\_Access\_Methods\_a
- typedef struct [Dwarf\\_Obj\\_Access\\_Section\\_a\\_s](#) Dwarf\_Obj\_Access\_Section\_a
- typedef struct Dwarf\_Rnglists\_Head\_s \* [Dwarf\\_Rnglists\\_Head](#)

## Enumerations

- enum [Dwarf\\_Sec\\_Alloc\\_Pref](#) { **Dwarf\_Alloc\_None** =0 , **Dwarf\_Alloc\_Malloc** =1 , **Dwarf\_Alloc\_Mmap** =2 }

### 9.3.1 Detailed Description

### 9.3.2 Typedef Documentation

#### 9.3.2.1 Dwarf\_Abbrev

[Dwarf\\_Abbrev](#)

Used to reference a Dwarf\_Abbrev. Usually Dwarf\_Abbrev are fully handled inside the library so one rarely needs to declare the type.

#### 9.3.2.2 Dwarf\_Arange

[Dwarf\\_Arange](#)

Used to reference a code address range in a section such as .debug\_info.

#### 9.3.2.3 Dwarf\_Attribute

[Dwarf\\_Attribute](#)

Used to reference a Dwarf\_Die attribute

#### 9.3.2.4 Dwarf\_Block

[Dwarf\\_Block](#)

Used to hold uninterpreted blocks of data. bl\_data refers to on an uninterpreted block of data Used with certain location information functions, a frame expression function, expanded frame instructions, and DW\_FORM\_block functions.

See also

[dwarf\\_formblock](#)

[Documenting Form\\_Block](#)

#### 9.3.2.5 Dwarf\_Cie

[Dwarf\\_Cie](#)

Used to reference .debug\_frame or .eh\_frame CIE.

#### 9.3.2.6 Dwarf\_Debug

[Dwarf\\_Debug](#)

An open Dwarf\_Debug points to data that libdwarf maintains to support libdwarf calls.

### 9.3.2.7 Dwarf\_Debug\_Addr\_Table

[Dwarf\\_Debug\\_Addr\\_Table](#)

Used to reference a table in section .debug\_addr

### 9.3.2.8 Dwarf\_Debug\_Fission\_Per\_CU

[Dwarf\\_Debug\\_Fission\\_Per\\_CU](#)

A handy short name for a [Dwarf\\_Debug\\_Fission\\_Per\\_CU\\_s](#) struct.

### 9.3.2.9 Dwarf\_Die

[Dwarf\\_Die](#)

Used to reference a DWARF Debugging Information Entry.

### 9.3.2.10 Dwarf\_Dnames\_Head

[Dwarf\\_Dnames\\_Head](#)

Used as the general reference to the DWARF5 .debug\_names section.

### 9.3.2.11 Dwarf\_Dsc\_Head

[Dwarf\\_Dsc\\_Head](#)

Access to DW\_AT\_discr\_list array of discriminant values.

### 9.3.2.12 Dwarf\_Error

```
Dwarf_Error  
Dwarf_Error error = 0;  
dres = dwarf_siblingof_c(in_die, &return_sib, &error);
```

&error is used in calls to return error details when the call returns DW\_DLV\_ERROR.

### 9.3.2.13 Dwarf\_Fde

[Dwarf\\_Fde](#)

Used to reference .debug\_frame or .eh\_frame FDE.

#### 9.3.2.14 Dwarf\_Form\_Data16

`Dwarf_Form_Data16`

a container for a DW\_FORM\_data16 data item. We have no integer types suitable so this special struct is used instead. It is up to consumers/producers to deal with the contents.

#### 9.3.2.15 Dwarf\_Frame\_Instr\_Head

`Dwarf_Frame_Instr_Head`

The basis for access to DWARF frame instructions (FDE or CIE) in full detail.

#### 9.3.2.16 Dwarf\_Func

`Dwarf_Func`

An SGI extension type which is no longer used at all. As of release 0.6.0 use Dwarf\_Global instead.

#### 9.3.2.17 Dwarf\_Gdbindex

`Dwarf_Gdbindex`

Used to reference .gdb\_index section data which is a fast-access section by and for gdb.

#### 9.3.2.18 Dwarf\_Global

`Dwarf_Global`

Used to reference a reference to an entry in the .debug\_pubnames section.

#### 9.3.2.19 Dwarf\_Gnu\_Index\_Head

`Dwarf_Gnu_Index_Head`

A pointer to a struct Dwarf\_Gnu\_Index\_Head\_s for sections .debug\_gnu\_pubtypes or .debug\_gnu\_pubnames. These are not standard DWARF, and can appear with gcc -gdwarf-5

#### 9.3.2.20 Dwarf\_Handler

`Dwarf_Handler`

Used in rare cases (mainly tiny programs) with `dwarf_init_path()` etc initialization calls to provide a pointer to a generic-error-handler function you write.

#### 9.3.2.21 Dwarf\_Line

[Dwarf\\_Line](#)

Used to reference a line reference from the .debug\_line section.

#### 9.3.2.22 Dwarf\_Line\_Context

[Dwarf\\_Line\\_Context](#)

Used as the general reference line data (.debug\_line).

#### 9.3.2.23 Dwarf\_Loc\_Head\_c

[Dwarf\\_Loc\\_Head\\_c](#)

provides access to any sort of location description for DWARF2,3,4, or 5.

#### 9.3.2.24 Dwarf\_Locdesc\_c

[Dwarf\\_Locdesc\\_c](#)

Provides access to Dwarf\_Locdesc\_c, a single location description

#### 9.3.2.25 Dwarf\_Macro\_Context

[Dwarf\\_Macro\\_Context](#)

Used as the general reference to DWARF5 .debug\_macro data.

#### 9.3.2.26 Dwarf\_Macro\_Details

[Dwarf\\_Macro\\_Details](#)

A handy short name for a Dwarf\_Macro\_Details\_S struct.

#### 9.3.2.27 Dwarf\_Obj\_Access\_Interface\_a

[Dwarf\\_Obj\\_Access\\_Interface\\_a](#)

Used for access to and setting up special data allowing access to DWARF even with no object files present

#### 9.3.2.28 Dwarf\_Obj\_Access\_Methods\_a

[Dwarf\\_Obj\\_Access\\_Methods\\_a](#)

Used for access to and setting up special data allowing access to DWARF even with no object files present

#### 9.3.2.29 Dwarf\_Obj\_Access\_Section\_a

[Dwarf\\_Obj\\_Access\\_Section\\_a](#)

Used for access to and setting up special data allowing access to DWARF even with no object files present. The fields match up with Elf section headers, but for non-Elf many of the fields can be set to zero.

#### 9.3.2.30 dwarf\_printf\_callback\_function\_type

[dwarf\\_printf\\_callback\\_function\\_type](#)

Used as a function pointer to a user-written callback function. This provides a detailed content of line table data.

The default contents of the callback data are all zero bytes. So no callbacks involving this data will be done.

See [dwarf\\_register\\_printf\\_callback\(\)](#)

##### Parameters

<i>dw_user_pointer</i>	Passes your callback a pointer to space you allocated as an identifier of some kind in calling dwarf_register_printf_callback..
<i>dw_linecontent</i>	Passes your callback null-terminated string with one line of detailed line table content.

#### 9.3.2.31 Dwarf\_Ranges

[Dwarf\\_Ranges](#)

Details of of non-contiguous address ranges of DIEs for DWARF2, DWARF3, and DWARF4. Sufficient for older dwarf.

dwr\_addr1 and dwr\_addr2 in the struct are offsets from a base address in the CU involved. To calculate actual range pc addresses see the example:

See also

[Example getting .debug\\_ranges data](#)

#### 9.3.2.32 Dwarf\_Regtable3

[Dwarf\\_Regtable3](#)

This structs provides a way for applications to select the number of frame registers and to select names for them.

rt3\_rules and rt3\_reg\_table\_size must be filled in before calling libdwf. Filled in with a pointer to an array (pointer and array set up by the calling application) of rt3\_reg\_table\_size [Dwarf\\_Regtable\\_Entry3\\_s](#) structs. libdwf does not allocate or deallocate space for the rules, you must do so. libdwf will initialize the contents rules array, you do not need to do so (though if you choose to initialize the array somehow that is ok: libdwf will overwrite your initializations with its own).

Note that this definition can only deal correctly with register table size that fits in a 16 bit unsigned value.

### 9.3.2.33 Dwarf\_Regtable\_Entry3

#### Dwarf\_Regtable\_Entry3

For each index *i* (naming a hardware register with dwarf number *i*) the following is true and defines the value of that register:

```
If dw_regnum is Register DW_FRAME_UNDEFINED_VAL
    it is not DWARF register number but
    a place holder indicating the register
    has no defined value.
If dw_regnum is Register DW_FRAME_SAME_VAL
    it is not DWARF register number but
    a place holder indicating the register has the same
    value in the previous frame.

    DW_FRAME_UNDEFINED_VAL, DW_FRAME_SAME_VAL and
    DW_FRAME_CFA_COL are only present at libdwarf runtime.
    Never on disk.
    DW_FRAME_* Values present on disk are in dwarf.h
    Because DW_FRAME_SAME_VAL and DW_FRAME_UNDEFINED_VAL
    and DW_FRAME_CFA_COL are definable at runtime
    consider the names symbolic in this comment,
    not absolute.

Otherwise: the register number is a DWARF register number
    (see ABI documents for how this translates to hardware/
    software register numbers in the machine hardware)
    and the following applies:

In a cfa-defining entry (rt3_cfa_rule) the regnum is the
CFA 'register number'. Which is some 'normal' register,
not DW_FRAME_CFA_COL, nor DW_FRAME_SAME_VAL, nor
DW_FRAME_UNDEFINED_VAL.

If dw_value_type == DW_EXPR_OFFSET (the only
possible case for dwarf2):
    If dw_offset_relevant is non-zero, then
        the value is stored at the address
        CFA+N where N (dw_offset) is a signed offset,
        (not unsigned) and must be cast to Dwarf_Signed
        before use.
        dw_regnum is the cfa register rule which means
        one ignores dw_regnum and uses the CFA appropriately.
        Rule: Offset(N)
    If dw_offset_relevant is zero, then the
        value of the register
        is the value of (DWARF) register number dw_regnum.
        Rule: register(R)
If dw_value_type == DW_EXPR_VAL_OFFSET
    the value of this register is CFA +N where
    N (dw_offset) is a signed offset (not unsigned)
    and must be cast to Dwarf_Signed before use.
    dw_regnum is the cfa register rule which means
    one ignores dw_regnum and uses the CFA appropriately.
    Rule: val_offset(N)
If dw_value_type == DW_EXPR_EXPRESSION
    The value of the register is the value at the address
    computed by evaluating the DWARF expression E.
    Rule: expression(E)
    The expression E byte stream is pointed to by
    block.bl_data.
    The expression length in bytes is given by
    block.bl_len.
If dw_value_type == DW_EXPR_VAL_EXPRESSION
    The value of the register is the value
    computed by evaluating the DWARF expression E.
    Rule: val_expression(E)
    The expression E byte stream is pointed to
    by block.bl_data.
```

The expression length in bytes is given by  
block.bl\_len.  
Other values of dw\_value\_type are an error.

DWARF is showing what a debugger would act on to calculate actual register values. Libdwarf does not know any register values and cannot calculate any. If a caller wishes to actually do the proper calculations the caller must provide its own register data space and calculate new values and new register status in the caller's register data.

Note that this definition can only deal correctly with register numbers that fit in a 16 bit unsigned value. Removing this restriction would force an incompatible change to several functions in the libdwarf API.

#### 9.3.2.34 Dwarf\_Rnglists\_Head

[Dwarf\\_Rnglists\\_Head](#)

Used for access to a set of DWARF5 debug\_rnglists entries.

#### 9.3.2.35 Dwarf\_Section

[Dwarf\\_Section](#)

An open Dwarf\_Section points to data that libdwarf maintains to record object section data.

#### 9.3.2.36 Dwarf\_Sig8

[Dwarf\\_Sig8](#)

Used for signatures where ever they appear. It is not a string, it is 8 bytes of a signature one would use to find a type unit.

See also

[dwarf\\_formsig8](#)

#### 9.3.2.37 Dwarf\_Str\_Offsets\_Table

[Dwarf\\_Str\\_Offsets\\_Table](#)

Provides an access to the .debug\_str\_offsets section independently of other DWARF sections. Mainly of use in examining the .debug\_str\_offsets section content for problems.

#### 9.3.2.38 Dwarf\_Type

[Dwarf\\_Type](#)

Before release 0.6.0 used to reference a reference to an entry in the .debug\_pubtypes section (as well as the SGI-only extension .debug\_types). However, we use Dwarf\_Global instead now.

### 9.3.2.39 Dwarf\_Var

[Dwarf\\_Var](#)

An SGI extension type which is no longer used at all. As of release 0.6.0 use Dwarf\_Global instead.

### 9.3.2.40 Dwarf\_Weak

[Dwarf\\_Weak](#)

An SGI extension type which is no longer used at all. As of release 0.6.0 use Dwarf\_Global instead.

### 9.3.2.41 Dwarf\_Xu\_Index\_Header

[Dwarf\\_Xu\\_Index\\_Header](#)

Used to reference .debug\_cu\_index or .debug\_tu\_index sections in a split-dwarf package file.

## 9.3.3 Enumeration Type Documentation

### 9.3.3.1 Dwarf\_Sec\_Alloc\_Pref

enum [Dwarf\\_Sec\\_Alloc\\_Pref](#)

Since

{0.12.0}

This is part of the allowance of mmap for loading sections of an object file.

The option of using mmap() only applies to Elf object files in this release.

### 9.6.1 Detailed Description

These identify the various error codes that have been used. Not all of them are still use. We do not recycle obsolete codes into new uses. The codes 1 through 22 are historic and it is unlikely they are used anywhere in the library.

### 9.6.2 Macro Definition Documentation

#### 9.6.2.1 DW\_DLE\_LAST

```
#define DW_DLE_LAST 511
```

#### Note

DW\_DLE\_LAST MUST EQUAL LAST ERROR NUMBER

## 9.7 Libdwarf Initialization Functions

### Functions

*Use with split dwarf.*

### 9.7.1 Detailed Description

### 9.7.2 Initialization And Finish Operations

Opening and closing libdwarf on object files.

### 9.7.3 Function Documentation

#### 9.7.3.1 dwarf\_finish()

```
DW_API int dwarf_finish (
    Dwarf\_Debug dw_dbg )
```

Close the initialized dw\_dbg and free all data libdwarf has for this dw\_dbg.

## Parameters

<i>dw_dbg</i>	Close the dbg.
---------------	----------------

## Returns

May return DW\_DLV\_ERROR if something is very wrong: no further information is available.. May return DW\_DLV\_NO\_ENTRY but no further information is available. Normally returns DW\_DLV\_OK.

There is nothing the caller can do with the return value except report it somehow. Most callers ignore the return value.

## 9.7.3.2 dwarf\_get\_tied\_dbg()

```
DW_API int dwarf_get_tied_dbg (
    Dwarf_Debug dw_dbg,
    Dwarf_Debug * dw_tieddbg_out,
    Dwarf_Error * dw_error )
```

Use with split dwarf.

Given a main Dwarf\_Debug this returns the tied Dwarf\_Debug if there is one or else returns null(0).

Before v0.11.0 it was not defined what this returned if the tied-Dwarf\_Debug was passed in, but it would have returned null(0) in that case. Unlikely anyone uses this call as callers had the tied and base dbg when calling [dwarf\\_set\\_tied\\_dbg\(\)](#).

## Parameters

<i>dw_dbg</i>	Pass in a non-null Dwarf_Debug which is either a main-Dwarf_Debug or a tied-Dwarf_Debug.
<i>dw_tieddbg_out</i>	On success returns the applicable tied-Dwarf_Debug through the pointer. If dw_dbg is a tied-Dwarf_Debug the function returns null(0) through the pointer. If there is no tied-Dwarf_Debug (meaning there is just a main-Dwarf_Debug) the function returns null (0) through the pointer.
<i>dw_error</i>	If the dw_dbg is invalid or damaged then the function returns DW_DLV_ERROR and dw_error is set to point to the error details.

## Returns

DW\_DLV\_OK or DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY.

## 9.7.3.3 dwarf\_init\_b()

```
DW_API int dwarf_init_b (
    int dw_fd,
    unsigned int dw_groupnumber,
    Dwarf_Handler dw_errhand,
    Dwarf_Ptr dw_errarg,
```

```
Dwarf_Debug * dw_dbg,
Dwarf_Error * dw_error )
```

Initialization based on Unix/Linux (etc) fd.

In case DW\_DLV\_ERROR returned be sure to call dwarf\_dealloc\_error even though the returned Dwarf\_Debug is NULL.

#### Parameters

<i>dw_fd</i>	An open Unix/Linux/etc fd on the object file.
<i>dw_groupnumber</i>	The value passed in should be DW_GROUPNUMBER_ANY unless one wishes to other than a standard group.
<i>dw_errhand</i>	Pass in NULL unless one wishes libdwarf to call this error handling function (which you must write) instead of passing meaningful values to the dw_error argument.
<i>dw_errarg</i>	If dw_errhand is non-null, then this value (a pointer or integer that means something to you) is passed to the dw_errhand function in case that is helpful to you.
<i>dw_dbg</i>	On success, *dw_dbg is set to a pointer to a new Dwarf_Debug structure to be used in calls to libdwarf functions.
<i>dw_error</i>	In case return is DW_DLV_ERROR dw_error is set to point to the error details.

#### Returns

DW\_DLV\_OK etc.

#### 9.7.3.4 dwarf\_init\_path()

```
DW_API int dwarf_init_path (
    const char * dw_path,
    char * dw_true_path_out_buffer,
    unsigned int dw_true_path_bufferlen,
    unsigned int dw_groupnumber,
    Dwarf_Handler dw_errhand,
    Dwarf_Ptr dw_errarg,
    Dwarf_Debug * dw_dbg,
    Dwarf_Error * dw_error )
```

Initialization based on path, the most common initialization.

On a Mach-O universal binary this function can only return information about the first (zero index) object in the universal binary.

#### Parameters

<i>dw_path</i>	Pass in the path to the object file to open.
<i>dw_true_path_out_buffer</i>	Pass in NULL or the name of a string buffer (The buffer should be initialized with an initial NUL byte) The returned string will be null-terminated. The path actually used is copied to true_path_out. If true_path_buffer len is zero or true_path_out_buffer is zero then the Special Macos processing will not occur, nor will the GNU_debuglink processing occur. In case GNU debuglink data was followed or Macos dSYM applies the true_path_out will not match path and the initial byte will be non-null. The value put in true_path_out is the actual file name.
<i>dw_true_path_bufferlen</i>	Pass in the length in bytes of the buffer.

## Parameters

<i>dw_groupnumber</i>	The value passed in should be DW_GROUPNUMBER_ANY unless one wishes to other than a standard group.
<i>dw_errhand</i>	Pass in NULL unless one wishes libdwarf to call this error handling function (which you must write) instead of passing meaningful values to the <i>dw_error</i> argument.
<i>dw_errarg</i>	If <i>dw_errhand</i> is non-null, then this value (a pointer or integer that means something to you) is passed to the <i>dw_errhand</i> function in case that is helpful to you.
<i>dw_dbg</i>	On success, <i>*dw_dbg</i> is set to a pointer to a new Dwarf_Debug structure to be used in calls to libdwarf functions.
<i>dw_error</i>	In case return is DW_DLV_ERROR <i>dw_error</i> is set to point to the error details.

## Returns

DW\_DLV\_OK etc.

[Details on separate DWARF object access](#)

## See also

[dwarf\\_init\\_path\\_dl](#) [dwarf\\_init\\_b](#)

[Using dwarf\\_init\\_path\(\)](#)

## 9.7.3.5 dwarf\_init\_path\_a()

```
DW_API int dwarf_init_path_a (
    const char * dw_path,
    char * dw_true_path_out_buffer,
    unsigned int dw_true_path_bufferlen,
    unsigned int dw_groupnumber,
    unsigned int dw_universalnumber,
    Dwarf_Handler dw_errhand,
    Dwarf_Ptr dw_errarg,
    Dwarf_Debug * dw_dbg,
    Dwarf_Error * dw_error )
```

Initialization based on path.

This identical to [dwarf\\_init\\_path\(\)](#) except that it adds a new argument, *dw\_universalnumber*, with which you can specify which object in a Mach-O universal binary you wish to open.

It is always safe and appropriate to pass zero as the *dw\_universalnumber*. Elf and PE and (non-universal) Mach-O object files ignore the value of *dw\_universalnumber*.

### 9.7.3.6 dwarf\_init\_path\_dl()

```
DW_API int dwarf_init_path_dl (
    const char * dw_path,
    char * dw_true_path_out_buffer,
    unsigned int dw_true_path_bufferlen,
    unsigned int dw_groupnumber,
    Dwarf_Handler dw_errhand,
    Dwarf_Ptr dw_errarg,
    Dwarf_Debug * dw_dbg,
    char ** dw_dl_path_array,
    unsigned int dw_dl_path_array_size,
    unsigned char * dw_dl_path_source,
    Dwarf_Error * dw_error )
```

Initialization following GNU debuglink section data.

Sets the true-path with DWARF if there is appropriate debuglink data available.

In case DW\_DLV\_ERROR returned be sure to call dwarf\_dealloc\_error even though the returned Dwarf\_Debug is NULL.

#### Parameters

<i>dw_path</i>	Pass in the path to the object file to open.
<i>dw_true_path_out_buffer</i>	Pass in NULL or the name of a string buffer.
<i>dw_true_path_bufferlen</i>	Pass in the length in bytes of the buffer.
<i>dw_groupnumber</i>	The value passed in should be DW_GROUPNUMBER_ANY unless one wishes to other than a standard group.
<i>dw_errhand</i>	Pass in NULL, normally. If non-null one wishes libdwarf to call this error handling function (which you must write) instead of passing meaningful values to the dw_error argument.
<i>dw_errarg</i>	Pass in NULL, normally. If dw_errorhand is non-null, then this value (a pointer or integer that means something to you) is passed to the dw_errhand function in case that is helpful to you.
<i>dw_dbg</i>	On success, *dw_dbg is set to a pointer to a new Dwarf_Debug structure to be used in calls to libdwarf functions.
<i>dw_dl_path_array</i>	debuglink processing allows a user-specified set of file paths and this argument allows one to specify these. Pass in a pointer to array of pointers to strings which you, the caller, have filled in. The strings should be alternate paths (see the GNU debuglink documentation.)
<i>dw_dl_path_array_size</i>	Specify the size of the dw_dl_path_array.
<i>dw_dl_path_source</i>	returns DW_PATHSOURCE_basic or other such value so the caller can know how the true-path was resolved.
<i>dw_error</i>	In case return is DW_DLV_ERROR dw_error is set to point to the error details.

#### Returns

DW\_DLV\_OK etc.

[Details on separate DWARF object access](#)

#### See also

[Using dwarf\\_init\\_path\\_dl\(\)](#)

### 9.7.3.7 dwarf\_init\_path\_dl\_a()

```
DW_API int dwarf_init_path_dl_a (
    const char * dw_path,
    char * dw_true_path_out_buffer,
    unsigned int dw_true_path_bufferlen,
    unsigned int dw_groupnumber,
    unsigned int dw_universalnumber,
    Dwarf_Handler dw_errhand,
    Dwarf_Ptr dw_errarg,
    Dwarf_Debug * dw_dbg,
    char ** dw_dl_path_array,
    unsigned int dw_dl_path_array_size,
    unsigned char * dw_dl_path_source,
    Dwarf_Error * dw_error )
```

Initialization based on path with debuglink.

This is identical to [dwarf\\_init\\_path\\_dl\(\)](#) except that it adds a new argument, `dw_universalnumber`, with which you can specify which object in a Mach-O universal binary you wish to open.

It is always safe and appropriate to pass zero as the `dw_universalnumber`. Elf and PE and (non-universal) Mach-O object files ignore the value of `dw_universalnumber`.

Mach-O objects do not contain or use debuglink data.

### 9.7.3.8 dwarf\_object\_finish()

```
DW_API int dwarf_object_finish (
    Dwarf_Debug dw_dbg )
```

Used to close the object\_init `dw_dbg`.

Close the `dw_dbg` opened by [dwarf\\_object\\_init\\_b\(\)](#).

#### Parameters

<code>dw_dbg</code>	Must be an open <code>Dwarf_Debug</code> opened by <a href="#">dwarf_object_init_b()</a> . The init call <code>dw_obj</code> data is not freed by the call to <code>dwarf_object_finish</code> .
---------------------	--

#### Returns

The return value `DW_DLV_OK` etc is useless, one could possibly report it somehow. Callers usually ignore the return value.

### 9.7.3.9 dwarf\_object\_init\_b()

```
DW_API int dwarf_object_init_b (
    Dwarf_Obj_Access_Interface_a * dw_obj,
    Dwarf_Handler dw_errhand,
    Dwarf_Ptr dw_errarg,
```

```

unsigned int dw_groupnumber,
Dwarf_Debug * dw_dbg,
Dwarf_Error * dw_error )

```

Used to access DWARF information in memory or in an object format unknown to libdwarf.

In case DW\_DLV\_ERROR returned be sure to call dwarf\_dealloc\_error even though the returned Dwarf\_Debug is NULL.

Since libdwarf is not reading the object directly in this case it us up to the code actually reading the object to check the object file for format and do sufficient format-specific checks for correctness and return DW\_DLV\_ERROR if object checks fail.

#### See also

userobjread <src/bin/dwarfexample/jitreader.c>

#### Parameters

<i>dw_obj</i>	A data structure filled out by the caller so libdwarf can access DWARF data not in a supported object file format.
<i>dw_errhand</i>	Pass in NULL normally.
<i>dw_groupnumber</i>	The value passed in should be DW_GROUPNUMBER_ANY unless one wishes to other than a standard group (quite unlikely for this interface).
<i>dw_dbg</i>	On success, *dw_dbg is set to a pointer to a new Dwarf_Debug structure to be used in calls to libdwarf functions.
<i>dw_error</i>	In case return is DW_DLV_ERROR dw_error is set to point to the error details.

#### Returns

The usual value: DW\_DLV\_OK etc.

### 9.7.3.10 dwarf\_set\_tied\_dbg()

```

DW_API int dwarf_set_tied_dbg (
    Dwarf_Debug dw_split_dbg,
    Dwarf_Debug dw_tied_dbg,
    Dwarf_Error * dw_error )

```

Use with split dwarf.

In libdwarf usage the object file being reported on [a] is opened with [dwarf\\_init\\_path\(\)](#) or the like. If that object file [a] is a split-dwarf object then important data needed to report all of what is in the object file [a] needs an open Dwarf\_Debug on the base object file [b] (usually the base executable object). Here we call that executable object file [b] the *tied* object.

See DWARF5 Appendix F.

#### Parameters

<i>dw_split_dbg</i>	Pass in an open dbg, on a split-dwarf object file with (normally) lots of DWARF but no executable code.
<i>dw_tied_dbg</i>	Pass in an open dbg on an executable (we call it a <i>tied</i> dbg here) which has minimal DWARF (to save space in the executable).
<i>dw_error</i>	In case return is DW_DLV_ERROR dw_error is set to point to the error details. <small>Generated by Doxygen</small>

## Returns

DW\_DLV\_OK etc.

## See also

[Attaching a tied dbg](#)

[Detaching a tied dbg](#)

## 9.8.1 Detailed Description

## 9.8.2 Function Documentation

### 9.8.2.1 dwarf\_child()

```
DW_API int dwarf_child (
    Dwarf_Die dw_die,
    Dwarf_Die * dw_return_chiiddie,
    Dwarf_Error * dw_error )
```

Return the child DIE, if any. The child may be the first of a list of sibling DIEs.

#### Parameters

<i>dw_die</i>	We will return the first child of this DIE.
<i>dw_return_chiiddie</i>	Returns the first child through the pointer. For subsequent dies siblings of the first, use <a href="#">dwarf_siblingof_c()</a> .
<i>dw_error</i>	The usual Dwarf_Error*.

#### Returns

Returns DW\_DLV\_OK etc. Returns DW\_DLV\_NO\_ENTRY if dw\_die has no children.

#### See also

[Using dwarf\\_child\(\)](#)

### 9.8.2.2 dwarf\_cu\_header\_basics()

```
DW_API int dwarf_cu_header_basics (
    Dwarf_Die dw_die,
    Dwarf_Half * dw_version,
    Dwarf_Bool * dw_is_info,
    Dwarf_Bool * dw_is_dwo,
    Dwarf_Half * dw_offset_size,
    Dwarf_Half * dw_address_size,
    Dwarf_Half * dw_extension_size,
    Dwarf_Sig8 ** dw_signature,
    Dwarf_Off * dw_offset_of_length,
    Dwarf_Unsigned * dw_total_byte_length,
    Dwarf_Error * dw_error )
```

Return some CU-relative facts.

Any Dwarf\_Die will work. The values returned through the pointers are about the CU for a DIE

#### Parameters

<i>dw_die</i>	Some open Dwarf_Die.
<i>dw_version</i>	Returns the DWARF version: 2,3,4, or 5

## Parameters

<i>dw_is_info</i>	Returns non-zero if the CU is .debug_info. Returns zero if the CU is .debug_types (DWARF4).
<i>dw_is_dwo</i>	Returns non-zero if the CU is a dwo/dwp object and zero if it is a standard object.
<i>dw_offset_size</i>	Returns offset size, 4 and 8 are possible.
<i>dw_address_size</i>	Almost always returns 4 or 8. Could be 2 in unusual circumstances.
<i>dw_extension_size</i>	The sum of <i>dw_offset_size</i> and <i>dw_extension_size</i> are the count of the initial bytes of the CU. Standard lengths are 4 and 12. For 1990's SGI objects the length could be 8.
<i>dw_signature</i>	Returns a pointer to an 8 byte signature.
<i>dw_offset_of_length</i>	Returns the section offset of the initial byte of the CU.
<i>dw_total_byte_length</i>	Returns the total length of the CU including the length field and the content of the CU.
<i>dw_error</i>	The usual Dwarf_Error*.

## Returns

Returns DW\_DLV\_OK etc.

## 9.8.2.3 dwarf\_dealloc\_die()

```
DW_API void dwarf_dealloc_die (
    Dwarf_Die dw_die )
```

Deallocate (free) a DIE.

## Parameters

<i>dw_die</i>	Frees (deallocs) memory associated with this Dwarf_Die.
---------------	---

DIEs not freed explicitly will be freed by [dwarf\\_finish\(\)](#).

## 9.8.2.4 dwarf\_die\_from\_hash\_signature()

```
DW_API int dwarf_die_from_hash_signature (
    Dwarf_Debug dw_dbg,
    Dwarf_Sig8 * dw_hash_sig,
    const char * dw_sig_type,
    Dwarf_Die * dw_returned_CU_die,
    Dwarf_Error * dw_error )
```

Return a CU DIE given a has signature.

## Parameters

<i>dw_dbg</i>	
<i>dw_hash_sig</i>	A pointer to an 8 byte signature to be looked up. in .debug_names.
<i>dw_sig_type</i>	Valid type requests are "cu" and "tu"
<i>dw_returned_CU_die</i>	Returns the found CU DIE if one is found.
<i>dw_error</i>	The usual Dwarf_Error*.

**Returns**

DW\_DLV\_OK means dw\_returned\_CU\_die was set. DW\_DLV\_NO\_ENTRY means the signature could not be found.

**9.8.2.5 dwarf\_find\_die\_given\_sig8()**

```
DW_API int dwarf_find_die_given_sig8 (
    Dwarf_Debug dw_dbg,
    Dwarf_Sig8 * dw_ref,
    Dwarf_Die * dw_die_out,
    Dwarf_Bool * dw_is_info,
    Dwarf_Error * dw_error )
```

Return a DIE given a Dwarf\_Sig8 hash.

Returns DIE and is\_info flag if it finds the hash signature of a DIE. Often will be the CU DIE of DW\_UT\_split\_type or DW\_UT\_type CU.

**Parameters**

<i>dw_dbg</i>	The applicable Dwarf_Debug
<i>dw_ref</i>	A pointer to a Dwarf_Sig8 struct whose content defines what is being searched for.
<i>dw_die_out</i>	If found, this returns the found DIE itself.
<i>dw_is_info</i>	If found, this returns section (.debug_is_info or .debug_is_types).
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc.

**9.8.2.6 dwarf\_get\_die\_infotypes\_flag()**

```
DW_API Dwarf_Bool dwarf_get_die_infotypes_flag (
    Dwarf_Die dw_die )
```

Return the is\_info flag.

So client software knows if a DIE is in debug\_info or (DWARF4-only) debug\_types.

**Parameters**

<i>dw_die</i>	The DIE being queried.
---------------	------------------------

**Returns**

If non-zero the flag means the DIE is in .debug\_info. Otherwise it means the DIE is in .debug\_types.

### 9.8.2.7 dwarf\_next\_cu\_header\_d()

```
DW_API int dwarf_next_cu_header_d (
    Dwarf_Debug dw_dbg,
    Dwarf_Bool dw_is_info,
    Dwarf_Unsigned * dw_cu_header_length,
    Dwarf_Half * dw_version_stamp,
    Dwarf_Off * dw_abbrev_offset,
    Dwarf_Half * dw_address_size,
    Dwarf_Half * dw_length_size,
    Dwarf_Half * dw_extension_size,
    Dwarf_Sig8 * dw_type_signature,
    Dwarf_Unsigned * dw_typeoffset,
    Dwarf_Unsigned * dw_next_cu_header_offset,
    Dwarf_Half * dw_header_cu_type,
    Dwarf_Error * dw_error )
```

Return information on the next CU header(d)

This is the version to use for linking against libdwarf v0.8.0 and earlier (and it also works for later versions).

Replace all uses of [dwarf\\_next\\_cu\\_header\\_d\(\)](#) and use [dwarf\\_next\\_cu\\_header\\_e](#) instead.

Assuming you continue to use [dwarf\\_next\\_cu\\_header\\_d\(\)](#) read the following carefully.

The library keeps track of where it is in the object file following a call to [dwarf\\_next\\_cu\\_header\\_d\(\)](#) and it knows (see next paragraph) how to interpret [dwarf\\_siblingof\\_b\(dw\\_dbg,NULL,dw\\_is\\_info, &cu\\_die,...\)](#).

In order to read the DIE tree of the CU this records information in the `dw_dbg` data and after a successful call to [dwarf\\_next\\_cu\\_header\\_d\(\)](#) only an immediate call to [dwarf\\_siblingof\\_b\(dw\\_dbg,NULL,dw\\_is\\_info, &cu\\_die,...\)](#) is guaranteed to return the correct DIE (a Compilation Unit DIE).

Avoid any call to libdwarf between a successful call to [dwarf\\_next\\_cu\\_header\\_d\(\)](#) and [dwarf\\_siblingof\\_b\(dw\\_dbg,↔ NULL,dw\\_is\\_info, &cu\\_die,...\)](#) to ensure the intended and correct Dwarf\_Die is returned.

See also

[Example walking CUs\(d\)](#)

All arguments are the same as [dwarf\\_next\\_cu\\_header\\_e\(\)](#) except that there is no `dw_cu_die` argument in [dwarf\\_next\\_cu\\_header\\_d\(\)](#).

### 9.8.2.8 dwarf\_next\_cu\_header\_e()

```
DW_API int dwarf_next_cu_header_e (
    Dwarf_Debug dw_dbg,
    Dwarf_Bool dw_is_info,
    Dwarf_Die * dw_cu_die,
    Dwarf_Unsigned * dw_cu_header_length,
    Dwarf_Half * dw_version_stamp,
    Dwarf_Off * dw_abbrev_offset,
    Dwarf_Half * dw_address_size,
    Dwarf_Half * dw_length_size,
    Dwarf_Half * dw_extension_size,
    Dwarf_Sig8 * dw_type_signature,
    Dwarf_Unsigned * dw_typeoffset,
```

```
Dwarf_Unsigned * dw_next_cu_header_offset,
Dwarf_Half * dw_header_cu_type,
Dwarf_Error * dw_error )
```

Return information on the next CU header(e).

New in v0.9.0 November 2023.

[dwarf\\_next\\_cu\\_header\\_e\(\)](#) is preferred over [dwarf\\_next\\_cu\\_header\\_d\(\)](#) as the latter requires a second (immediate) step to access the CU-DIE of the CU.

With the CU-DIE returned by [dwarf\\_next\\_cu\\_header\\_e\(\)](#) one calls [dwarf\\_child\(\)](#) first (the CU-DIE has no siblings) and then one calls [dwarf\\_siblingof\\_c\(\)](#) and [dwarf\\_child\(\)](#) appropriately to descend the tree of DIEs.

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_is_info</i>	Pass in TRUE if reading through .debug_info Pass in FALSE if reading through DWARF4 .debug_types.
<i>dw_cu_die</i>	Pass in a pointer to a Dwarf_Die. the call sets the passed-in pointer to be a Compilation Unit Die for use with <a href="#">dwarf_child()</a> or any other call requiring a Dwarf_Die argument.
<i>dw_cu_header_length</i>	Returns the length of the just-read CU header.
<i>dw_version_stamp</i>	Returns the version number (2 to 5) of the CU header just read.
<i>dw_abbrev_offset</i>	Returns the .debug_abbrev offset from the the CU header just read.
<i>dw_address_size</i>	Returns the address size specified for this CU, usually either 4 or 8.
<i>dw_length_size</i>	Returns the offset size (the length of the size field from the header) specified for this CU, either 4 or 4.
<i>dw_extension_size</i>	If the section is standard 64bit DWARF then this value is 4. Else the value is zero.
<i>dw_type_signature</i>	If the CU is DW_UT_skeleton DW_UT_split_compile, DW_UT_split_type or DW_UT_type this is the type signature from the CU_header compiled into this field.
<i>dw_typeoffset</i>	For DW_UT_split_type or DW_UT_type this is the type offset from the CU header.
<i>dw_next_cu_header_offset</i>	The offset in the section of the next CU (unless there is a compiler bug this is rarely of interest).
<i>dw_header_cu_type</i>	Returns DW_UT_compile, or other DW_UT value.
<i>dw_error</i>	In case return is DW_DLV_ERROR dw_error is set to point to the error details.

#### Returns

Returns DW\_DLV\_OK on success. Returns DW\_DLV\_NO\_ENTRY if all CUs have been read.

#### See also

[Example walking CUs\(e\)](#)

#### 9.8.2.9 dwarf\_offdie\_b()

```
DW_API int dwarf_offdie_b (
    Dwarf_Debug dw_dbg,
```

```

Dwarf_Off dw_offset,
Dwarf_Bool dw_is_info,
Dwarf_Die * dw_return_die,
Dwarf_Error * dw_error )

```

Return DIE given global (not CU-relative) offset.

This works whether or not the target section has had [dwarf\\_next\\_cu\\_header\\_d\(\)](#) applied, the CU the offset exists in has been seen at all, or the target offset is one libdwarf has seen before.

#### Parameters

<i>dw_dbg</i>	The applicable Dwarf_Debug
<i>dw_offset</i>	The global offset of the DIE in the appropriate section.
<i>dw_is_info</i>	Pass TRUE if the target is .debug_info. Pass FALSE if the target is .debug_types.
<i>dw_return_die</i>	On success this returns a DIE pointer to the found DIE.
<i>dw_error</i>	The usual Dwarf_Error*.

#### Returns

DW\_DLX\_OK means *dw\_returned\_die* was found DW\_DLX\_NO\_ENTRY is only possible if the offset is to a null DIE, and that is very unusual. Otherwise expect DW\_DLX\_ERROR.

#### See also

[Using dwarf\\_offdie\\_b\(\)](#)

#### 9.8.2.10 dwarf\_siblingof\_b()

```

DW_API int dwarf_siblingof_b (
    Dwarf_Debug dw_dbg,
    Dwarf_Die dw_die,
    Dwarf_Bool dw_is_info,
    Dwarf_Die * dw_return_siblingdie,
    Dwarf_Error * dw_error )

```

Return the first DIE or the next sibling DIE.

This function follows [dwarf\\_next\\_cu\\_header\\_d\(\)](#) to return the CU-DIE that [dwarf\\_next\\_cu\\_header\\_d\(\)](#) implies but does not reveal.

Aside from the special case required use of [dwarf\\_siblingof\\_b\(\)](#) immediately following [dwarf\\_next\\_cu\\_header\\_d\(\)](#), [dwarf\\_siblingof\\_c\(\)](#) is the faster function.

This function will eventually be deprecated.

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug one is operating on.
<i>dw_die</i>	Immediately after calling <a href="#">dwarf_next_cu_header_d</a> pass in NULL to retrieve the CU DIE. Or pass in a known DIE and this will retrieve the next sibling in the chain.
<i>dw_is_info</i>	Pass TRUE or FALSE to match the applicable <a href="#">dwarf_next_cu_header_d</a> call.
<i>dw_return_siblingdie</i>	The DIE returned through the pointer.
<i>dw_error</i>	The usual error information, if any.

**Returns**

Returns DW\_DLV\_OK etc.

**See also**

example4

dwarf\_get\_die\_infotypes

**9.8.2.11 dwarf\_siblingof\_c()**

```
DW_API int dwarf_siblingof_c (
    Dwarf_Die dw_die,
    Dwarf_Die * dw_return_siblingdie,
    Dwarf_Error * dw_error )
```

Return the next sibling DIE.

**Parameters**

<i>dw_die</i>	Pass in a known DIE and this will retrieve the next sibling in the chain.
<i>dw_return_siblingdie</i>	The DIE returned through the pointer.
<i>dw_error</i>	The usual error information, if any.

**Returns**

Returns DW\_DLV\_OK etc.

**See also**

example4

dwarf\_get\_die\_infotypes

**9.9 Debugging Information Entry (DIE) content****Functions**

- DW\_API int [dwarf\\_die\\_abbrev\\_global\\_offset](#) ([Dwarf\\_Die](#) dw\_die, [Dwarf\\_Off](#) \*dw\_abbrev\_offset, [Dwarf\\_Unsigned](#) \*dw\_abbrev\_count, [Dwarf\\_Error](#) \*dw\_error)

*Return the CU DIE section offset given CU header offset.*
- DW\_API int [dwarf\\_die\\_CU\\_offset](#) (Dwarf\_Die dw\_die, Dwarf\_Off \*dw\_return\_offset, Dwarf\_Error \*dw\_error)

*returns the CU relative offset of the DIE.*
- DW\_API int [dwarf\\_die\\_CU\\_offset\\_range](#) (Dwarf\_Die dw\_die, Dwarf\_Off \*dw\_return\_CU\_header\_offset, Dwarf\_Off \*dw\_return\_CU\_length\_bytes, Dwarf\_Error \*dw\_error)

*Return the offset length of the entire CU of a DIE.*
- DW\_API int [dwarf\\_attr](#) (Dwarf\_Die dw\_die, Dwarf\_Half dw\_attrnum, Dwarf\_Attribute \*dw\_returned\_attr, Dwarf\_Error \*dw\_error)

*Given DIE and attribute number return a Dwarf\_attribute.*
- DW\_API int [dwarf\\_die\\_text](#) (Dwarf\_Die dw\_die, Dwarf\_Half dw\_attrnum, char \*\*dw\_ret\_name, Dwarf\_Error \*dw\_error)

*Given DIE and attribute number return a string.*
- DW\_API int [dwarf\\_diename](#) (Dwarf\_Die dw\_die, char \*\*dw\_diename, Dwarf\_Error \*dw\_error)

*Return the string from a DW\_AT\_name attribute.*
- DW\_API Dwarf\_Unsigned [dwarf\\_die\\_abbrev\\_code](#) (Dwarf\_Die dw\_die)

*Return the DIE abbrev code.*
- DW\_API int [dwarf\\_die\\_abbrev\\_children\\_flag](#) (Dwarf\_Die dw\_die, Dwarf\_Half \*dw\_ab\_has\_child)

*Return TRUE if the DIE has children.*
- DW\_API int [dwarf\\_validate\\_die\\_sibling](#) (Dwarf\_Die dw\_sibling, Dwarf\_Off \*dw\_offset)

*Validate a sibling DIE.*
- DW\_API int [dwarf\\_hasattr](#) (Dwarf\_Die dw\_die, Dwarf\_Half dw\_attrnum, Dwarf\_Bool \*dw\_returned\_bool, Dwarf\_Error \*dw\_error)

*Tells whether a DIE has a particular attribute.*
- DW\_API int [dwarf\\_offset\\_list](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Off dw\_offset, Dwarf\_Bool dw\_is\_info, Dwarf\_Off \*\*dw\_offbuf, Dwarf\_Unsigned \*dw\_offcount, Dwarf\_Error \*dw\_error)

*Return an array of DIE children offsets.*
- DW\_API int [dwarf\\_get\\_die\\_address\\_size](#) (Dwarf\_Die dw\_die, Dwarf\_Half \*dw\_addr\_size, Dwarf\_Error \*dw↔\_error)

*Get the address size applying to a DIE.*
- DW\_API int [dwarf\\_die\\_offsets](#) (Dwarf\_Die dw\_die, Dwarf\_Off \*dw\_global\_offset, Dwarf\_Off \*dw\_local↔\_offset, Dwarf\_Error \*dw\_error)

*Return section and CU-local offsets of a DIE.*
- DW\_API int [dwarf\\_get\\_version\\_of\\_die](#) (Dwarf\_Die dw\_die, Dwarf\_Half \*dw\_version, Dwarf\_Half \*dw↔\_offset\_size)

*Get the version and offset size.*
- DW\_API int [dwarf\\_lowpc](#) (Dwarf\_Die dw\_die, Dwarf\_Addr \*dw\_returned\_addr, Dwarf\_Error \*dw\_error)

*Return the DW\_AT\_low\_pc value.*
- DW\_API int [dwarf\\_highpc\\_b](#) (Dwarf\_Die dw\_die, Dwarf\_Addr \*dw\_return\_addr, Dwarf\_Half \*dw\_return↔\_form, enum Dwarf\_Form\_Class \*dw\_return\_class, Dwarf\_Error \*dw\_error)

*Return the DW\_AT\_highpc address value.*
- DW\_API int [dwarf\\_dietype\\_offset](#) (Dwarf\_Die dw\_die, Dwarf\_Off \*dw\_return\_offset, Dwarf\_Bool \*dw\_is\_info, Dwarf\_Error \*dw\_error)

*Return the offset from the DW\_AT\_type attribute.*
- DW\_API int [dwarf\\_bytesize](#) (Dwarf\_Die dw\_die, Dwarf\_Unsigned \*dw\_returned\_size, Dwarf\_Error \*dw↔\_error)

*Return the value of the attribute DW\_AT\_byte\_size.*

- DW\_API int [dwarf\\_bitsize](#) ([Dwarf\\_Die](#) dw\_die, [Dwarf\\_Unsigned](#) \*dw\_returned\_size, [Dwarf\\_Error](#) \*dw\_error)  
*Return the value of the attribute DW\_AT\_bitsize.*
- DW\_API int [dwarf\\_bitoffset](#) ([Dwarf\\_Die](#) dw\_die, [Dwarf\\_Half](#) \*dw\_attrnum, [Dwarf\\_Unsigned](#) \*dw\_returned\_offset, [Dwarf\\_Error](#) \*dw\_error)  
*Return the bit offset attribute of a DIE.*
- DW\_API int [dwarf\\_srclang](#) ([Dwarf\\_Die](#) dw\_die, [Dwarf\\_Unsigned](#) \*dw\_returned\_lang, [Dwarf\\_Error](#) \*dw\_error)  
*Return the value of the DW\_AT\_language attribute.*
- DW\_API int [dwarf\\_srclanglname](#) ([Dwarf\\_Die](#) dw\_die, [Dwarf\\_Unsigned](#) \*dw\_returned\_lname, [Dwarf\\_Error](#) \*dw\_error)  
*Return the value of the DW\_AT\_language\_name attribute.*
- DW\_API int [dwarf\\_srclanglname\\_version](#) ([Dwarf\\_Die](#) dw\_die, const char \*dw\_returned\_verstring, [Dwarf\\_Error](#) \*dw\_error)  
*Return the value of the DW\_AT\_language\_version attribute.*
- DW\_API int [dwarf\\_language\\_version\\_data](#) ([Dwarf\\_Unsigned](#) dw\_lname\_name, int \*dw\_default\_lower\_bound, const char \*\*dw\_version\_string)  
*Return values associated with DW\_AT\_language\_name.*
- DW\_API int [dwarf\\_language\\_version\\_string](#) ([Dwarf\\_Unsigned](#) dw\_lname\_name, int \*dw\_default\_lower\_bound, const char \*\*dw\_version\_string)  
*dwarf\_language\_version\_string is obsolete.*
- DW\_API int [dwarf\\_lvn\\_name\\_direct](#) ([Dwarf\\_Unsigned](#) dw\_lv\_lang, [Dwarf\\_Unsigned](#) dw\_lv\_ver, const char \*\*dw\_ret\_version\_name, const char \*\*dw\_ret\_version\_scheme)  
*Return language version name.*
- DW\_API int [dwarf\\_lvn\\_name](#) ([Dwarf\\_Die](#) dw\_die, const char \*\*dw\_ret\_version\_name, const char \*\*dw\_ret\_version\_scheme)  
*Return values associated with DW\_AT\_language\_version.*
- DW\_API int [dwarf\\_lvn\\_table\\_entry](#) ([Dwarf\\_Unsigned](#) dw\_lvn\_index, [Dwarf\\_Unsigned](#) \*dw\_lvn\_language\_name, [Dwarf\\_Unsigned](#) \*dw\_lvn\_language\_version, const char \*\*dw\_lvn\_language\_version\_scheme, const char \*\*dw\_lvn\_language\_version\_name)  
*Return values from the DWARF6 language version standard.*
- DW\_API int [dwarf\\_arrayorder](#) ([Dwarf\\_Die](#) dw\_die, [Dwarf\\_Unsigned](#) \*dw\_returned\_order, [Dwarf\\_Error](#) \*dw\_error)  
*Return the value of the DW\_AT\_ordering attribute.*

## 9.9.1 Detailed Description

This is the main interface to attributes of a DIE.

## 9.9.2 Function Documentation

### 9.9.2.1 dwarf\_addr\_form\_is\_indexed()

```
DW_API Dwarf_Bool dwarf_addr_form_is_indexed (
    int dw_form )
```

Informs if a DW\_FORM is an indexed form.

Reading a CU DIE with DW\_AT\_low\_pc an indexed value can be problematic as several different FORMs are indexed. Some in DWARF5 others being extensions to DWARF4 and DWARF5. Indexed forms interact with DW\_AT\_addr\_base in a DIE making this a very relevant distinction.

### 9.9.2.2 dwarf\_arrayorder()

```
DW_API int dwarf_arrayorder (
    Dwarf_Die dw_die,
    Dwarf_Unsigned * dw_returned_order,
    Dwarf_Error * dw_error )
```

Return the value of the DW\_AT\_ordering attribute.

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_returned_order</i>	On success returns the ordering value. For example DW_ORD_row_major
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.9.2.3 dwarf\_attr()

```
DW_API int dwarf_attr (
    Dwarf_Die dw_die,
    Dwarf_Half dw_attrnum,
    Dwarf_Attribute * dw_returned_attr,
    Dwarf_Error * dw_error )
```

Given DIE and attribute number return a Dwarf\_attribute.

Returns DW\_DLV\_NO\_ENTRY if the DIE has no attribute dw\_attrnum.

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_attrnum</i>	An attribute number, for example DW_AT_name.
<i>dw_returned_attr</i>	On success a Dwarf_Attribute pointer is returned and it should eventually be deallocated.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.9.2.4 dwarf\_bitoffset()

```
DW_API int dwarf_bitoffset (
    Dwarf_Die dw_die,
    Dwarf_Half * dw_attrnum,
    Dwarf_Unsigned * dw_returned_offset,
    Dwarf_Error * dw_error )
```

Return the bit offset attribute of a DIE.

If the attribute is DW\_AT\_data\_bit\_offset (DWARF4, DWARF5) the returned bit offset has one meaning. If the attribute is DW\_AT\_bit\_offset (DWARF2, DWARF3) the meaning is quite different.

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_attrnum</i>	If successful, returns the number of the attribute (DW_AT_data_bit_offset or DW_AT_bit_offset)
<i>dw_returned_offset</i>	If successful, returns the bit offset value.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.5 dwarf\_bitsize()

```
DW_API int dwarf_bitsize (
    Dwarf_Die dw_die,
    Dwarf_Unsigned * dw_returned_size,
    Dwarf_Error * dw_error )
```

Return the value of the attribute DW\_AT\_bitsize.

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_returned_size</i>	If successful, returns the size through the pointer.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.6 dwarf\_bytesize()

```
DW_API int dwarf_bytesize (
    Dwarf_Die dw_die,
    Dwarf_Unsigned * dw_returned_size,
    Dwarf_Error * dw_error )
```

Return the value of the attribute DW\_AT\_byte\_size.

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_returned_size</i>	If successful, returns the size through the pointer.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc.

**9.9.2.7 dwarf\_CU\_dieoffset\_given\_die()**

```
DW_API int dwarf_CU_dieoffset_given_die (
    Dwarf_Die dw_die,
    Dwarf_Off * dw_return_offset,
    Dwarf_Error * dw_error )
```

Return the CU DIE offset given any DIE.

Returns the global debug\_info section offset of the CU DIE in the CU containing the given\_die (the passed in DIE can be any DIE).

This does not identify whether the section is .debug\_info or .debug\_types, use [dwarf\\_get\\_die\\_infotypes\\_flag\(\)](#) to determine the section.

**See also**

[dwarf\\_get\\_cu\\_die\\_offset\\_given\\_cu\\_header\\_offset\\_b](#)  
[Using dwarf\\_offset\\_given\\_die\(\)](#)

**Parameters**

<i>dw_die</i>	The DIE being queried.
<i>dw_return_offset</i>	Returns the section offset of the CU DIE for dw_die.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc.

**9.9.2.8 dwarf\_debug\_addr\_index\_to\_addr()**

```
DW_API int dwarf_debug_addr_index_to_addr (
    Dwarf_Die dw_die,
    Dwarf_Unsigned dw_index,
    Dwarf_Addr * dw_return_addr,
    Dwarf_Error * dw_error )
```

Extract address given address index. DWARF5.

Useful for checking for compiler/linker errors in the creation of DWARF5.

**Parameters**

<i>dw_die</i>	The DIE of interest
<i>dw_index</i>	An index into .debug_addr. This will look first for .debug_addr in the dbg object DIE and if not there will look in the tied object if that is available.
<i>dw_return_addr</i>	On success the address is returned through the pointer.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc.

**9.9.2.9 dwarf\_die\_abbrev\_children\_flag()**

```
DW_API int dwarf_die_abbrev_children_flag (
    Dwarf_Die dw_die,
    Dwarf_Half * dw_ab_has_child )
```

Return TRUE if the DIE has children.

**Parameters**

<i>dw_die</i>	A valid DIE pointer (not NULL).
<i>dw_ab_has_child</i>	Sets TRUE though the pointer if the DIE has children. Otherwise sets FALSE.

**Returns**

Returns TRUE if the DIE has a child DIE. Else returns FALSE.

**9.9.2.10 dwarf\_die\_abbrev\_code()**

```
DW_API Dwarf_Unsigned dwarf_die_abbrev_code (
    Dwarf_Die dw_die )
```

Return the DIE abbrev code.

The Abbrev code for a DIE is a positive integer assigned by the compiler within a particular CU. For .debug\_names abbreviations the situation is conceptually similar. The code values are arbitrary but compilers are motivated to make them small so the object size is as small as possible.

Returns the abbrev code of the die. Cannot fail.

**Parameters**

<i>dw_die</i>	The DIE of interest.
---------------	----------------------

**Returns**

The abbrev code. of the DIE.

**9.9.2.11 dwarf\_die\_abbrev\_global\_offset()**

```
DW_API int dwarf_die_abbrev_global_offset (
    Dwarf_Die dw_die,
    Dwarf_Off * dw_abbrev_offset,
```

```
Dwarf_Unsigned * dw_abbrev_count,
Dwarf_Error * dw_error )
```

Return the abbrev section offset of a DIE's abbrevs.

So we can associate a DIE's abbreviations with the contents the abbreviations section. Useful for detailed printing and analysis of abbreviations.

#### Parameters

<i>dw_die</i>	The DIE of interest
<i>dw_abbrev_offset</i>	On success is set to the global offset in the .debug_abbrev section of the abbreviations for the DIE.
<i>dw_abbrev_count</i>	On success is set to the count of abbreviations in the .debug_abbrev section of the abbreviations for the DIE.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.12 dwarf\_die\_CU\_offset()

```
DW_API int dwarf_die_CU_offset (
    Dwarf_Die dw_die,
    Dwarf_Off * dw_return_offset,
    Dwarf_Error * dw_error )
```

returns the CU relative offset of the DIE.

#### See also

[dwarf\\_CU\\_dieoffset\\_given\\_die](#)

This does not identify whether the section is .debug\_info or .debug\_types, use [dwarf\\_get\\_die\\_infotypes\\_flag\(\)](#) to determine the section.

#### Parameters

<i>dw_die</i>	The DIE being queried.
<i>dw_return_offset</i>	Returns the CU relative offset of this DIE.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.13 dwarf\_die\_CU\_offset\_range()

```
DW_API int dwarf_die_CU_offset_range (
    Dwarf_Die dw_die,
```

```

Dwarf_Off * dw_return_CU_header_offset,
Dwarf_Off * dw_return_CU_length_bytes,
Dwarf_Error * dw_error )

```

Return the offset length of the entire CU of a DIE.

This does not identify whether the section is `.debug_info` or `.debug_types`, use `dwarf_get_die_infotypes_flag()` to determine the section.

#### Parameters

<i>dw_die</i>	The DIE being queried.
<i>dw_return_CU_header_offset</i>	On success returns the section offset of the CU this DIE is in.
<i>dw_return_CU_length_bytes</i>	On success returns the CU length of the CU this DIE is in, including the CU length, header, and all DIEs.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.14 dwarf\_die\_offsets()

```

DW_API int dwarf_die_offsets (
    Dwarf_Die dw_die,
    Dwarf_Off * dw_global_offset,
    Dwarf_Off * dw_local_offset,
    Dwarf_Error * dw_error )

```

Return section and CU-local offsets of a DIE.

This does not identify whether the section is `.debug_info` or `.debug_types`, use `dwarf_get_die_infotypes_flag()` to determine the section.

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_global_offset</i>	On success returns the offset of the DIE in its section.
<i>dw_local_offset</i>	On success returns the offset of the DIE within its CU.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.15 dwarf\_die\_text()

```

DW_API int dwarf_die_text (
    Dwarf_Die dw_die,

```

```
Dwarf_Half dw_attrnum,
char ** dw_ret_name,
Dwarf_Error * dw_error )
```

Given DIE and attribute number return a string.

Returns DW\_DLV\_NO\_ENTRY if the DIE has no attribute dw\_attrnum.

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_attrnum</i>	An attribute number, for example DW_AT_name.
<i>dw_ret_name</i>	On success a pointer to the string is returned. Do not free the string. Many attributes allow various forms that directly or indirectly contain strings and this returns the string.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.16 dwarf\_diename()

```
DW_API int dwarf_diename (
    Dwarf_Die dw_die,
    char ** dw_diename,
    Dwarf_Error * dw_error )
```

Return the string from a DW\_AT\_name attribute.

Returns DW\_DLV\_NO\_ENTRY if the DIE has no attribute DW\_AT\_name

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_diename</i>	On success a pointer to the string is returned. Do not free the string. Various forms directly or indirectly contain strings and this follows all of them to their string.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.17 dwarf\_dieoffset()

```
DW_API int dwarf_dieoffset (
    Dwarf_Die dw_die,
    Dwarf_Off * dw_return_offset,
    Dwarf_Error * dw_error )
```

Return the global section offset of the DIE.

## Parameters

<i>dw_die</i>	The DIE of interest
<i>dw_return_offset</i>	On success the offset refers to the section of the DIE itself, which may be <code>.debug_offset</code> or <code>.debug_types</code> .
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

**9.9.2.18 dwarf\_dietype\_offset()**

```
DW_API int dwarf_dietype_offset (
    Dwarf_Die dw_die,
    Dwarf_Off * dw_return_offset,
    Dwarf_Bool * dw_is_info,
    Dwarf_Error * dw_error )
```

Return the offset from the DW\_AT\_type attribute.

The offset returned is a global offset from the DW\_AT\_type of the DIE passed in. If this CU is DWARF4 the offset could be in `.debug_types`, otherwise it is in `.debug_info`. Check the section of the DIE to know which it is, [dwarf\\_cu\\_header\\_basics\(\)](#) will return that.

Added pointer argument to return the section the offset applies to. December 2022.

## Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_return_offset</i>	If successful, returns the offset through the pointer.
<i>dw_is_info</i>	If successful, set to TRUE if the <code>dw_return_offset</code> is in <code>.debug_info</code> and FALSE if the <code>dw_return_offset</code> is in <code>.debug_types</code> .
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

**9.9.2.19 dwarf\_get\_cu\_die\_offset\_given\_cu\_header\_offset\_b()**

```
DW_API int dwarf_get_cu_die_offset_given_cu_header_offset_b (
    Dwarf_Debug dw_dbg,
    Dwarf_Off dw_in_cu_header_offset,
    Dwarf_Bool dw_is_info,
    Dwarf_Off * dw_out_cu_die_offset,
    Dwarf_Error * dw_error )
```

Return the CU DIE section offset given CU header offset.

Returns the CU DIE global offset if one knows the CU header global offset.

See also

[dwarf\\_CU\\_dieoffset\\_given\\_die](#)

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_in_cu_header_offset</i>	The CU header offset.
<i>dw_is_info</i>	If TRUE the CU header offset is in .debug_info. Otherwise the CU header offset is in .debug_types.
<i>dw_out_cu_die_offset</i>	The CU DIE offset returned through this pointer.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.20 dwarf\_get\_die\_address\_size()

```
DW_API int dwarf_get_die_address_size (
    Dwarf_Die dw_die,
    Dwarf_Half * dw_addr_size,
    Dwarf_Error * dw_error )
```

Get the address size applying to a DIE.

#### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_addr_size</i>	On success, returns the address size that applies to dw_die. Normally 4 or 8.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.21 dwarf\_get\_version\_of\_die()

```
DW_API int dwarf_get_version_of_die (
    Dwarf_Die dw_die,
    Dwarf_Half * dw_version,
    Dwarf_Half * dw_offset_size )
```

Get the version and offset size.

The values returned apply to the CU this DIE belongs to. This is useful as preparation for calling [dwarf\\_get\\_form\\_class](#)

## Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_version</i>	Returns the version of the CU this DIE is contained in. Standard version numbers are 2 through 5.
<i>dw_offset_size</i>	Returns the offset_size (4 or 8) of the CU this DIE is contained in.

## Returns

On success, returns DW\_DLV\_OK. If *dw\_die* is null or its contents are corrupted returns DW\_DLV\_ERROR and there is nothing useful returned. Never returns DW\_DLV\_NO\_ENTRY.

**9.9.2.22 dwarf\_hasattr()**

```
DW_API int dwarf_hasattr (
    Dwarf_Die dw_die,
    Dwarf_Half dw_attrnum,
    Dwarf_Bool * dw_returned_bool,
    Dwarf_Error * dw_error )
```

Tells whether a DIE has a particular attribute.

## Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_attrnum</i>	The attribute number we are asking about, DW_AT_name for example.
<i>dw_returned_bool</i>	On success is set TRUE if <i>dw_die</i> has <i>dw_attrnum</i> and FALSE otherwise.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Never returns DW\_DLV\_NO\_ENTRY. Returns DW\_DLV\_OK unless there is an error, in which case it returns DW\_DLV\_ERROR and sets *dw\_error* to the error details.

**9.9.2.23 dwarf\_highpc\_b()**

```
DW_API int dwarf_highpc_b (
    Dwarf_Die dw_die,
    Dwarf_Addr * dw_return_addr,
    Dwarf_Half * dw_return_form,
    enum Dwarf_Form_Class * dw_return_class,
    Dwarf_Error * dw_error )
```

Return the DW\_AT\_highpc address value.

This is accessing the DW\_AT\_highpc attribute. Calculating the high pc involves elements which we don't describe here, but which are shown in the example. See the DWARF5 standard.

## See also

[Reading high pc from a DIE.](#)

## Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_return_addr</i>	On success returns the high-pc address for this DIE. If the high-pc is a not DW_FORM_addr and is a non-indexed constant form one must add the value of the DW_AT_low_pc to this to get the true high-pc value as the value returned is an unsigned offset of the associated low-pc value.
<i>dw_return_form</i>	On success returns the actual FORM for this attribute. Needed for certain cases to calculate the true dw_return_addr;
<i>dw_return_class</i>	On success returns the FORM CLASS for this attribute. Needed for certain cases to calculate the true dw_return_addr;
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

## 9.9.2.24 dwarf\_language\_version\_data()

```
DW_API int dwarf_language_version_data (
    Dwarf_Unsigned dw_lname_name,
    int * dw_default_lower_bound,
    const char ** dw_version_string )
```

Return values associated with DW\_AT\_language\_name.

Returns the value of a the default-lower-bound and a string defining the interpretation of the DWARF6 version from the DW\_AT\_language\_version attribute. Replaces [dwarf\\_language\\_version\\_string\(\)](#).

## Parameters

<i>dw_lname_name</i>	Pass in a DW_LNAME value, for example DW_LNAME_C (0x0003).
<i>dw_default_lower_bound.</i>	On success returns the language code (normally only found on a CU DIE). For example DW_LNAME_C has a default lower bound of zero (0) that will be returned through the pointer.
<i>dw_version_scheme</i>	On success, return the version scheme, For DW_LNAME_C the string returned through the pointer would by "YYYYMM". If there is no version scheme defined, return a NULL through the pointer. Never dealloc or free() the string returned through dw_version_scheme as it is a static constant string.

## Returns

Returns DW\_DLV\_OK or the dw\_lang\_name is unknown, returns DW\_DLV\_NO\_ENTRY. Never returns DW\_DLV\_ERROR;

## 9.9.2.25 dwarf\_language\_version\_string()

```
DW_API int dwarf_language_version_string (
    Dwarf_Unsigned dw_lname_name,
```

```
int * dw_default_lower_bound,
const char ** dw_version_string )
```

`dwarf_language_version_string` is obsolete.

OBSOLETE NAME. Do Not use `dwarf_language_version_string()` use `dwarf_language_version_data()`.

#### 9.9.2.26 dwarf\_lowpc()

```
DW_API int dwarf_lowpc (
    Dwarf_Die dw_die,
    Dwarf_Addr * dw_returned_addr,
    Dwarf_Error * dw_error )
```

Return the DW\_AT\_low\_pc value.

##### Parameters

<code>dw_die</code>	The DIE of interest.
<code>dw_returned_addr</code>	On success returns, through the pointer, the address DW_AT_low_pc defines.
<code>dw_error</code>	The usual error detail return pointer.

##### Returns

Returns DW\_DLV\_OK etc.

#### 9.9.2.27 dwarf\_lvn\_name()

```
DW_API int dwarf_lvn_name (
    Dwarf_Die dw_die,
    const char ** dw_ret_version_name,
    const char ** dw_ret_version_scheme )
```

Return values associated with DW\_AT\_language\_version.

New in version 2.2.0 July 2025

Given any valid DIE for a Compilation Unit returns the value of a the CU\_DIE name of the DWARF6 DW\_AT\_language\_version as a string, as "C++98" for example. And the string defining the format of the language version, for example "YYYYMM" if DW\_LNAME\_C. Never free or dealloc the returned string, it is static memory @param dw\_die Pass in any valid open Dwarf\_Die for the compilation unit of interest. @param dw\_reg\_version\_name On success returns the language version name string through the pointer. Never dealloc or free the string, it points to static memory. @param dw\_ret\_version\_scheme On success, return the version scheme, For DW\_LNAME\_C the string returned through the pointer would be "YYYYMM". If there is no version scheme defined, return a NULL through the pointer. Never dealloc or free() the string returned through dw\_version\_scheme as it is a static constant string.

##### Returns

Returns DW\_DLV\_OK or the dw\_lang\_name is unknown, returns DW\_DLV\_NO\_ENTRY. Never returns DW\_DLV\_ERROR;

**9.9.2.28 dwarf\_lvn\_name\_direct()**

```
DW_API int dwarf_lvn_name_direct (
    Dwarf_Unsigned dw_lv_lang,
    Dwarf_Unsigned dw_lv_ver,
    const char ** dw_ret_version_name,
    const char ** dw_ret_version_scheme )
```

Return language version name.

New in version 2.2.0 July 2025

Returns the value of a the name of the DWARF6 DW\_AT\_language\_version as a string, as "C++98" for example. And the string defining the format of the language version, for example "YYYYMM" if DW\_LNAME\_C. Never free or dealloc the returned string, it is static memory @param dw\_lv\_lang Pass in a DW\_LNAME value, for example DW\_LNAME\_C (0x0003). @param Pass in the language version, for example 201103 (meaning C++ 11). @param dw\_ret\_version\_name On success, return the name of the version, "C++11" for example. Never free or dealloc the string. @param dw\_reg\_version\_scheme On success, returns For DW\_LNAME\_C the string returned through the pointer would be "YYYYMM". If there is no version scheme defined, return a NULL through the pointer. Never dealloc or free() the string returned through dw\_version\_scheme as it is a static constant string.

**Returns**

Returns DW\_DLV\_OK or the dw\_lang\_name is unknown, returns DW\_DLV\_NO\_ENTRY. Never returns DW\_DLV\_ERROR;

**9.9.2.29 dwarf\_lvn\_table\_entry()**

```
DW_API int dwarf_lvn_table_entry (
    Dwarf_Unsigned dw_lvn_index,
    Dwarf_Unsigned * dw_lvn_language_name,
    Dwarf_Unsigned * dw_lvn_language_version,
    const char ** dw_lvn_language_version_scheme,
    const char ** dw_lvn_language_version_name )
```

Return values from the DWARF6 language version standard.

New in version 2.2.0 July 2025

Primarily used by dwarfdump. This enables access to the instances of DWARF6 language version table known to this version of libdwarf. None of the strings returned through pointers should be dealloc-d or free-d, they are static strings.

**Parameters**

<i>dw_lvn_index</i>	To see all table entries, pass in the index of a table entry, beginning with 0, and call again with subsequent numbers until the function returns DW_DLV_NO_ENTRY (meaning there are no more entries). The index has no intrinsic meaning.
<i>dw_lvn_language_name</i>	On success, the function returns the language name through the pointer. For example, a value like DW_LNAME_C.
<i>dw_lvn_language_version</i>	On success, the function returns the language version through the pointer. For example a number such as for C: 199901.
<i>dw_lvn_language_version_scheme</i>	On success, the function returns a pointer to a string identifying the format of the language version through the pointer. For example "YYYYMM" for C.
<small>Generated by Doxygen</small> <i>dw_lvn_language_version_name</i>	On success, the function returns a pointer to a string for C. identifying the name of the language version through the pointer. For example: "C99".

## Returns

## 9.9.2.30 dwarf\_offset\_list()

```
DW_API int dwarf_offset_list (
    Dwarf_Debug dw_dbg,
    Dwarf_Off dw_offset,
    Dwarf_Bool dw_is_info,
    Dwarf_Off ** dw_offbuf,
    Dwarf_Unsigned * dw_offcount,
    Dwarf_Error * dw_error )
```

Return an array of DIE children offsets.

Given a DIE section offset and dw\_is\_info, returns an array of DIE global [section] offsets of the children of DIE.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_offset</i>	A DIE offset.
<i>dw_is_info</i>	If TRUE says to use the offset in .debug_info. Else use the offset in .debug_types.
<i>dw_offbuf</i>	A pointer to an array of children DIE global [section] offsets is returned through the pointer.
<i>dw_offcount</i>	The number of elements in dw_offbuf. If the DIE has no children it could be zero, in which case dw_offbuf and dw_offcount are not touched.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc. DW\_DLV\_NO\_ENTRY means there are no children of the DIE, hence no list of child offsets.

On successful return, use dwarf\_dealloc(dbg, dw\_offbuf, DW\_DLA\_UARRAY); to dealloc the allocated space.

## See also

[Using dwarf\\_offset\\_list\(\)](#)

## 9.9.2.31 dwarf\_srclang()

```
DW_API int dwarf_srclang (
    Dwarf_Die dw_die,
    Dwarf_Unsigned * dw_returned_lang,
    Dwarf_Error * dw_error )
```

Return the value of the DW\_AT\_language attribute.

Returns DWARF5 DW\_LANG language name. The DW\_LANG value returned lets one access the LANG name as a string with [dwarf\\_get\\_LANG\\_name\(\)](#)

To access DW\_LNAME names (in DWARF5 or later) see [dwarf\\_srclangname\(\)](#). To get the DW\_LNAME as a string, call [dwarf\\_get\\_LNAME\\_name\(\)](#).

DWARF5 and earlier

The DIE should be a CU DIE.

## Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_returned_lang</i>	On success returns the language code (normally only found on a CU DIE). For example DW_LANG_C (0x0002).
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLX\_OK etc.

**9.9.2.32 dwarf\_srclanglname()**

```
DW_API int dwarf_srclanglname (
    Dwarf_Die dw_die,
    Dwarf_Unsigned * dw_returned_lname,
    Dwarf_Error * dw_error )
```

Return the value of the DW\_AT\_language\_name attribute.

New in v2.1.0 July 2025.

Returns a DWARF6 DW\_AT\_language\_name name. The DW\_LNAME value returned lets one access the LNAME name as a string with [dwarf\\_get\\_LNAME\\_name\(\)](#) Also see [dwarf\\_language\\_version\\_data\(\)](#) for valued based on DW\_LNAME names.

To access DW\_LANG names (in DWARF5 or earlier) see [dwarf\\_srclang\(\)](#).

## Parameters

<i>dw_die</i>	The DIE of interest, normally a CU_DIE.
<i>dw_returned_lname</i>	On success returns the language name (code) (normally only found on a CU DIE). For example DW_LNAME_C (0x0003).
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLX\_OK etc.

**9.9.2.33 dwarf\_srclanglname\_version()**

```
DW_API int dwarf_srclanglname_version (
    Dwarf_Die dw_die,
    const char * dw_returned_verstring,
    Dwarf_Error * dw_error )
```

Return the value of the DW\_AT\_language\_version attribute.

New in v2.1.0 July 2025.

Finds the DW\_AT\_language\_version of the DIE if one is present.

The DIE should be a CU DIE.

## Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_returned</i>	verstring On success returns the language version string from a DW_AT_language_version attributes (normally only found on a CU DIE). For example DW_LNAME_C would return a pointer to "YYYYMM" Never free or dealloc the string returned through dw_returned_verstring, it is in static memory.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

**9.9.2.34 dwarf\_tag()**

```
DW_API int dwarf_tag (
    Dwarf_Die dw_die,
    Dwarf_Half * dw_return_tag,
    Dwarf_Error * dw_error )
```

Get TAG value of DIE.

## Parameters

<i>dw_die</i>	The DIE of interest
<i>dw_return_tag</i>	On success, set to the DW_TAG value of the DIE.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

**9.9.2.35 dwarf\_validate\_die\_sibling()**

```
DW_API int dwarf_validate_die_sibling (
    Dwarf_Die dw_sibling,
    Dwarf_Off * dw_offset )
```

Validate a sibling DIE.

This is used by dwarfdump (when dwarfdump is checking for valid DWARF) to try to catch a corrupt DIE tree.

This does not identify whether the section is .debug\_info or .debug\_types, use [dwarf\\_get\\_die\\_infotypes\\_flag\(\)](#) to determine the section.

## See also

[using dwarf\\_validate\\_die\\_sibling](#)

## Parameters

<i>dw_sibling</i>	Pass in a DIE returned by <a href="#">dwarf_siblingof_b()</a> .
<i>dw_offset</i>	Set to zero through the pointer.

## Returns

Returns DW\_DLV\_OK if the sibling is at an appropriate place in the section. Otherwise it returns DW\_DLV\_↔ ERROR indicating the DIE tree is corrupt.

## 9.10 DIE Attribute and Attribute-Form Details

## Functions

- DW\_API int [dwarf\\_attrlist](#) ([Dwarf\\_Die](#) dw\_die, [Dwarf\\_Attribute](#) \*\*dw\_attrbuf, [Dwarf\\_Signed](#) \*dw\_attrcount, [Dwarf\\_Error](#) \*dw\_error)

\*dw\_out\_type, Dwarf\_Signed \*dw\_out\_discr\_low, Dwarf\_Signed \*dw\_out\_discr\_high, Dwarf\_Error \*dw\_↵  
\_error)  
*Access to a single signed discriminant list entry.*

### 9.10.1 Detailed Description

Access to the details of DIEs

### 9.10.2 Function Documentation

#### 9.10.2.1 dwarf\_attr\_offset()

```
DW_API int dwarf_attr_offset (
    Dwarf_Die dw_die,
    Dwarf_Attribute dw_attr,
    Dwarf_Off * dw_return_offset,
    Dwarf_Error * dw_error )
```

Return the offset of an attribute in its section.

##### Parameters

<i>dw_die</i>	The DIE of interest.
<i>dw_attr</i>	A Dwarf_Attribute of interest in this DIE
<i>dw_return_offset</i>	The offset is in .debug_info if the DIE is there. The offset is in .debug_types if the DIE is there.
<i>dw_error</i>	The usual error pointer.

##### Returns

DW\_DLX\_OK if it succeeds. DW\_DLX\_NO\_ENTRY is impossible.

#### 9.10.2.2 dwarf\_attrlist()

```
DW_API int dwarf_attrlist (
    Dwarf_Die dw_die,
    Dwarf_Attribute ** dw_attrbuf,
    Dwarf_Signed * dw_attrcount,
    Dwarf_Error * dw_error )
```

Gets the full list of attributes.

##### Parameters

<i>dw_die</i>	The DIE from which to pull attributes.
<i>dw_attrbuf</i>	The pointer is set to point to an array of Dwarf_Attribute (pointers to attribute data). This array must eventually be deallocated.
<i>dw_attrcount</i>	The number of entries in the array of pointers. There is no null-pointer to terminate the list, use this count.
<i>dw_error</i>	A place to return error details.

**Returns**

If it returns DW\_DLV\_ERROR and dw\_error is non-null it creates an Dwarf\_Error and places it in this argument. Usually returns DW\_DLV\_OK.

**See also**

[Using dwarf\\_attrlist\(\)](#)

[Using dwarf\\_attrlist\(\)](#)

**9.10.2.3 dwarf\_convert\_to\_global\_offset()**

```
DW_API int dwarf_convert_to_global_offset (
    Dwarf_Attribute dw_attr,
    Dwarf_Off dw_offset,
    Dwarf_Off * dw_return_offset,
    Dwarf_Error * dw_error )
```

Convert local offset to global offset.

Uses the DW\_FORM of the attribute to determine if the dw\_offset is local, and if so, adds the CU base offset to adjust dw\_offset.

**Parameters**

<i>dw_attr</i>	The attribute the local offset was extracted from.
<i>dw_offset</i>	The global offset of the attribute.
<i>dw_return_offset</i>	The returned section (global) offset.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds. Returns DW\_DLV\_ERROR if the dw\_attr form is not an offset form (for example, DW\_FORM\_ref\_udata).

**9.10.2.4 dwarf\_dealloc\_attribute()**

```
DW_API void dwarf_dealloc_attribute (
    Dwarf_Attribute dw_attr )
```

Dealloc a Dwarf\_Attribute When this call returns the dw\_attr is a stale pointer.

**Parameters**

<i>dw_attr</i>	The attribute to dealloc.
----------------	---------------------------

**9.10.2.5 dwarf\_dealloc\_uncompressed\_block()**

```
DW_API void dwarf_dealloc_uncompressed_block (
    Dwarf_Debug dw_dbg,
    void * dw_value_array )
```

Dealloc what dwarf\_uncompress\_integer\_block\_a allocated.

**Parameters**

<i>dw_dbg</i>	The Dwarf_Debug of interest
<i>dw_value_array</i>	The array was called an array of Dwarf_Signed. We dealloc all of it without needing dw_value_count.

**9.10.2.6 dwarf\_discr\_entry\_s()**

```
DW_API int dwarf_discr_entry_s (
    Dwarf_Dsc_Head dw_dsc,
    Dwarf_Unsigned dw_entrynum,
    Dwarf_Half * dw_out_type,
    Dwarf_Signed * dw_out_discr_low,
    Dwarf_Signed * dw_out_discr_high,
    Dwarf_Error * dw_error )
```

Access to a single signed discriminant list entry.

The same as dwarf\_discr\_entry\_u except here the values are signed.

**9.10.2.7 dwarf\_discr\_entry\_u()**

```
DW_API int dwarf_discr_entry_u (
    Dwarf_Dsc_Head dw_dsc,
    Dwarf_Unsigned dw_entrynum,
    Dwarf_Half * dw_out_type,
    Dwarf_Unsigned * dw_out_discr_low,
    Dwarf_Unsigned * dw_out_discr_high,
    Dwarf_Error * dw_error )
```

Access a single unsigned discriminant list entry.

It is up to the caller to know whether the discriminant values are signed or unsigned (therefore to know whether this or dwarf\_discr\_entry\_s. should be called)

**Parameters**

<i>dw_dsc</i>	The Dwarf_Dsc_Head applicable.
<i>dw_entrynum</i>	Valid values are zero to dw_dsc_array_length_out-1
<i>dw_out_type</i>	On success is set to either DW_DSC_label or DW_DSC_range through the pointer.
<i>dw_out_discr_low</i>	On success set to the lowest in this discriminant range
<i>dw_out_discr_high</i>	On success set to the highest in this discriminant range
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.10.2.8 dwarf\_discr\_list()**

```
DW_API int dwarf_discr_list (
    Dwarf_Debug dw_dbg,
    Dwarf_Small * dw_blockpointer,
    Dwarf_Unsigned dw_blocklen,
    Dwarf_Dsc_Head * dw_dsc_head_out,
    Dwarf_Unsigned * dw_dsc_array_length_out,
    Dwarf_Error * dw_error )
```

Return an array of discriminant values.

This applies if a DW\_TAG\_variant has one of the DW\_FORM\_block forms.

**See also**

[dwarf\\_formblock](#)

For an example of use and dealloc:

**See also**

[Using dwarf\\_discr\\_list\(\)](#)

**Parameters**

<i>dw_dbg</i>	The applicable Dwarf_Debug
<i>dw_blockpointer</i>	The bl_data value from a Dwarf_Block.
<i>dw_blocklen</i>	The bl_len value from a Dwarf_Block.
<i>dw_dsc_head_out</i>	On success returns a pointer to an array of discriminant values in an opaque struct.
<i>dw_dsc_array_length_out</i>	On success returns the number of entries in the dw_dsc_head_out array.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.10.2.9 dwarf\_formaddr()**

```
DW_API int dwarf_formaddr (
    Dwarf_Attribute dw_attr,
    Dwarf_Addr * dw_returned_addr,
    Dwarf_Error * dw_error )
```

Return the address when the attribute has form address.

There are several address forms, some of them indexed.

## Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_addr</i>	On success this set through the pointer to the address in the attribute.
<i>dw_error</i>	A place to return error details.

## Returns

On success returns DW\_DLV\_OK sets *dw\_returned\_addr* . If attribute is passed in NULL or the attribute is badly broken or the address cannot be retrieved the call returns DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY.

**9.10.2.10 dwarf\_formblock()**

```
DW_API int dwarf_formblock (
    Dwarf_Attribute dw_attr,
    Dwarf_Block ** dw_returned_block,
    Dwarf_Error * dw_error )
```

Return an allocated filled-in Form\_Block.

It is an error if the DW\_FORM in the attribute is not a block form. DW\_FORM\_block2 is an example of a block form.

## See also

[Dwarf\\_Block](#)

[Using dwarf\\_discr\\_list\(\)](#)

## Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_block</i>	Allocates a Dwarf_Block and returns a pointer to the filled-in block.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds. Never returns DW\_DLV\_NO\_ENTRY.

**9.10.2.11 dwarf\_formdata16()**

```
DW_API int dwarf_formdata16 (
    Dwarf_Attribute dw_attr,
    Dwarf_Form_Data16 * dw_returned_val,
    Dwarf_Error * dw_error )
```

Return a 16 byte Dwarf\_Form\_Data16 value.

We just store the bytes in a struct, we have no 16 byte integer type. It is an error if the FORM is not DW\_FORM\_data16

See also

[Dwarf\\_Form\\_Data16](#)

#### Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_val</i>	Copies the 16 byte value into the pointed to area.
<i>dw_error</i>	The usual error pointer.

#### Returns

DW\_DLV\_OK if it succeeds. Never returns DW\_DLV\_NO\_ENTRY.

### 9.10.2.12 dwarf\_formexprloc()

```
DW_API int dwarf_formexprloc (
    Dwarf_Attribute dw_attr,
    Dwarf_Unsigned * dw_return_exprlen,
    Dwarf_Ptr * dw_block_ptr,
    Dwarf_Error * dw_error )
```

Return a pointer-to and length-of a block of data.

#### Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_return_exprlen</i>	Returns the length in bytes of the block if it succeeds.
<i>dw_block_ptr</i>	Returns a pointer to the first byte of the block of data if it succeeds.
<i>dw_error</i>	The usual error pointer.

#### Returns

DW\_DLV\_OK if it succeeds. If the attribute form is not DW\_FORM\_exprloc it returns DW\_DLV\_ERROR and sets dw\_error to point to the error details.

### 9.10.2.13 dwarf\_formflag()

```
DW_API int dwarf_formflag (
    Dwarf_Attribute dw_attr,
    Dwarf_Bool * dw_returned_bool,
    Dwarf_Error * dw_error )
```

Return the flag value of a flag form.

It is an error if the FORM is not a flag form.

#### Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_bool</i>	Returns either TRUE or FALSE through the pointer.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds. Never returns DW\_DLV\_NO\_ENTRY.

**9.10.2.14 dwarf\_formref()**

```
DW_API int dwarf_formref (
    Dwarf_Attribute dw_attr,
    Dwarf_Off * dw_return_offset,
    Dwarf_Bool * dw_is_info,
    Dwarf_Error * dw_error )
```

Retrieve the CU-relative offset of a reference.

The DW\_FORM of the attribute must be one of a small set of local reference forms: DW\_FORM\_ref<n> or DW\_FORM\_uda.

**Parameters**

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_return_offset</i>	Returns the CU-relative offset through the pointer.
<i>dw_is_info</i>	Returns a flag through the pointer. TRUE if the offset is in .debug_info, FALSE if it is in .debug_types
<i>dw_error</i>	A place to return error details.

**Returns**

Returns DW\_DLV\_OK and sets dw\_returned\_attnum If attribute is passed in NULL or the attribute is badly broken or the FORM of this attribute is not one of the small set of local references the call returns DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY;

**9.10.2.15 dwarf\_formsdata()**

```
DW_API int dwarf_formsdata (
    Dwarf_Attribute dw_attr,
    Dwarf_Signed * dw_returned_val,
    Dwarf_Error * dw_error )
```

Return a signed value.

The form must be a signed integral type. It is an error otherwise.

**Parameters**

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_val</i>	On success returns the signed value through the pointer.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds. Never returns DW\_DLV\_NO\_ENTRY.

**9.10.2.16 dwarf\_formsig8()**

```
DW_API int dwarf_formsig8 (
    Dwarf_Attribute dw_attr,
    Dwarf_Sig8 * dw_returned_sig_bytes,
    Dwarf_Error * dw_error )
```

Return an 8 byte reference form for DW\_FORM\_ref\_sig8.

**Parameters**

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_sig_bytes</i>	On success returns DW_DLV_OK and copies the 8 bytes into dw_returned_sig_bytes.
<i>dw_error</i>	A place to return error details.

**Returns**

On success returns DW\_DLV\_OK and copies the 8 bytes into dw\_returned\_sig\_bytes. If attribute is passed in NULL or the attribute is badly broken the call returns DW\_DLV\_ERROR. If the dw\_attr has a form other than DW\_FORM\_ref\_sig8 the function returns DW\_DLV\_NO\_ENTRY

**9.10.2.17 dwarf\_formsig8\_const()**

```
DW_API int dwarf_formsig8_const (
    Dwarf_Attribute dw_attr,
    Dwarf_Sig8 * dw_returned_sig_bytes,
    Dwarf_Error * dw_error )
```

Return an 8 byte reference form for DW\_FORM\_data8.

**Parameters**

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_sig_bytes</i>	On success Returns DW_DLV_OK and copies the 8 bytes into dw_returned_sig_bytes.
<i>dw_error</i>	A place to return error details.

**Returns**

On success returns DW\_DLV\_OK and copies the 8 bytes into dw\_returned\_sig\_bytes. If attribute is passed in NULL or the attribute is badly broken the call returns DW\_DLV\_ERROR. If the dw\_attr has a form other than DW\_FORM\_data8 the function returns DW\_DLV\_NO\_ENTRY

**9.10.2.18 dwarf\_formstring()**

```
DW_API int dwarf_formstring (
    Dwarf_Attribute dw_attr,
```

```
char ** dw_returned_string,
Dwarf_Error * dw_error )
```

Return a pointer to a string.

#### Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_string</i>	On success puts a pointer to a string existing in an appropriate DWARF section into <i>dw_returned_string</i> . Never free() or dealloc the returned string.
<i>dw_error</i>	The usual error pointer.

#### Returns

DW\_DLV\_OK if it succeeds.

#### 9.10.2.19 dwarf\_formudata()

```
DW_API int dwarf_formudata (
    Dwarf_Attribute dw_attr,
    Dwarf_Unsigned * dw_returned_val,
    Dwarf_Error * dw_error )
```

Return an unsigned value.

The form can be an unsigned or signed integral type but if it is a signed type the value must be non-negative. It is an error otherwise.

#### Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_val</i>	On success returns the unsigned value through the pointer.
<i>dw_error</i>	The usual error pointer.

#### Returns

DW\_DLV\_OK if it succeeds. Never returns DW\_DLV\_NO\_ENTRY.

#### 9.10.2.20 dwarf\_get\_debug\_addr\_index()

```
DW_API int dwarf_get_debug_addr_index (
    Dwarf_Attribute dw_attr,
    Dwarf_Unsigned * dw_return_index,
    Dwarf_Error * dw_error )
```

Get the addr index of a Dwarf\_Attribute.

So a consumer can get the index when the object with the actual .debug\_addr section is elsewhere (Debug Fission). Or if the caller just wants the index. Only call it when you know it should have an index address FORM such as DW\_FORM\_addrx1 or one of the GNU address index forms.

## Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_return_index</i>	If successful it returns the index through the pointer.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds. Never returns DW\_DLV\_NO\_ENTRY.

**9.10.2.21 dwarf\_get\_debug\_str\_index()**

```
DW_API int dwarf_get_debug_str_index (
    Dwarf_Attribute dw_attr,
    Dwarf_Unsigned * dw_return_index,
    Dwarf_Error * dw_error )
```

Return a string index.

## Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_return_index</i>	If the form is a string index form (for example DW_FORM_strx) the string index value is returned via the pointer.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds. If the attribute form is not one of the string index forms it returns DW\_DLV\_ERROR and sets dw\_error to point to the error details.

**9.10.2.22 dwarf\_get\_form\_class()**

```
DW_API enum Dwarf_Form_Class dwarf_get_form_class (
    Dwarf_Half dw_version,
    Dwarf_Half dw_attrnum,
    Dwarf_Half dw_offset_size,
    Dwarf_Half dw_form )
```

Return the FORM\_CLASS applicable. Four pieces of information are necessary to get the correct FORM\_CLASS.

## Parameters

<i>dw_version</i>	The CU's DWARF version. Standard numbers are 2,3,4, or 5.
<i>dw_attrnum</i>	For example DW_AT_name
<i>dw_offset_size</i>	The offset size applicable to the compilation unit relevant to the attribute and form.
<i>dw_form</i>	The FORM number, for example DW_FORM_data4

**Returns**

Returns a form class, for example DW\_FORM\_CLASS\_CONSTANT. The FORM\_CLASS names are mentioned (for example as 'address' in Table 2.3 of DWARF5) but are not assigned formal names & numbers in the standard.

**9.10.2.23 dwarf\_global\_formref()**

```
DW_API int dwarf_global_formref (
    Dwarf_Attribute dw_attr,
    Dwarf_Off * dw_return_offset,
    Dwarf_Error * dw_error )
```

Same as dwarf\_global\_formref\_b except...

**See also**

[dwarf\\_global\\_formref\\_b](#)

This is the same, except there is no dw\_offset\_is\_info pointer so in the case of DWARF4 and DW\_FORM\_ref\_sig8 it is not possible to determine which section the offset applies to!

**9.10.2.24 dwarf\_global\_formref\_b()**

```
DW_API int dwarf_global_formref_b (
    Dwarf_Attribute dw_attr,
    Dwarf_Off * dw_return_offset,
    Dwarf_Bool * dw_offset_is_info,
    Dwarf_Error * dw_error )
```

Return the section-relative offset of a Dwarf\_Attribute.

The target section of the returned offset can be in various sections depending on the FORM. Only a DW\_FORM\_ref\_sig8 can change the returned offset of a .debug\_info DIE via a lookup into .debug\_types by changing dw\_offset\_is\_info to FALSE (DWARF4).

The caller must determine the target section from the FORM.

**Parameters**

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_return_offset</i>	Returns the CU-relative offset through the pointer.
<i>dw_offset_is_info</i>	For references to DIEs this informs whether the target DIE (the target the offset refers to) is in .debug_info or .debug_types. For non-DIE targets this field is not meaningful. Refer to the attribute FORM to determine the target section of the offset.
<i>dw_error</i>	A place to return error details.

**Returns**

Returns DW\_DLV\_OK and sets dw\_return\_offset and dw\_offset\_is\_info. If attribute is passed in NULL or the attribute is badly broken or the FORM of this attribute is not one of the many reference types the call returns DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY;

### 9.10.2.25 dwarf\_hasform()

```
DW_API int dwarf_hasform (
    Dwarf_Attribute dw_attr,
    Dwarf_Half dw_form,
    Dwarf_Bool * dw_returned_bool,
    Dwarf_Error * dw_error )
```

Sets TRUE if a Dwarf\_Attribute has the indicated FORM.

#### Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_form</i>	The DW_FORM you are asking about, DW_FORM_strp for example.
<i>dw_returned_bool</i>	The pointer passed in must be a valid non-null pointer to a Dwarf_Bool. On success, sets the value to TRUE or FALSE.
<i>dw_error</i>	A place to return error details.

#### Returns

Returns DW\_DLV\_OK and sets dw\_returned\_bool. If attribute is passed in NULL or the attribute is badly broken the call returns DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY;

### 9.10.2.26 dwarf\_uncompress\_integer\_block\_a()

```
DW_API int dwarf_uncompress_integer_block_a (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_input_length_in_bytes,
    void * dw_input_block,
    Dwarf_Unsigned * dw_value_count,
    Dwarf_Signed ** dw_value_array,
    Dwarf_Error * dw_error )
```

Uncompress a block of sleb numbers It's not much of a compression so not much of an uncompression. Developed by Sun Microsystems and it is unclear if it was ever used.

#### See also

[dwarf\\_dealloc\\_uncompressed\\_block](#)

### 9.10.2.27 dwarf\_whatattr()

```
DW_API int dwarf_whatattr (
    Dwarf_Attribute dw_attr,
    Dwarf_Half * dw_returned_attrnum,
    Dwarf_Error * dw_error )
```

Return the attribute number of the Dwarf\_Attribute.

## Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_attrnum</i>	The attribute number of the attribute is returned through the pointer. For example, DW_AT_name
<i>dw_error</i>	A place to return error details.

## Returns

Returns DW\_DLV\_OK and sets dw\_returned\_attrnum If attribute is passed in NULL or the attribute is badly broken the call returns DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY;

## 9.10.2.28 dwarf\_whatform()

```
DW_API int dwarf_whatform (
    Dwarf_Attribute dw_attr,
    Dwarf_Half * dw_returned_final_form,
    Dwarf_Error * dw_error )
```

Return the form of the Dwarf\_Attribute.

## Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_final_form</i>	The form of the item is returned through the pointer. If the base form is DW_FORM_indirect the function resolves the final form and returns that final form.
<i>dw_error</i>	A place to return error details.

## Returns

Returns DW\_DLV\_OK and sets dw\_returned\_final\_form If attribute is passed in NULL or the attribute is badly broken the call returns DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY;

## 9.10.2.29 dwarf\_whatform\_direct()

```
DW_API int dwarf_whatform_direct (
    Dwarf_Attribute dw_attr,
    Dwarf_Half * dw_returned_initial_form,
    Dwarf_Error * dw_error )
```

Return the initial form of the Dwarf\_Attribute.

## Parameters

<i>dw_attr</i>	The Dwarf_Attribute of interest.
<i>dw_returned_initial_form</i>	The form of the item is returned through the pointer. If the base form is DW_FORM_indirect the value set is DW_FORM_indirect.
<i>dw_error</i>	A place to return error details.

## Returns

Returns DW\_DLV\_OK and sets dw\_returned\_initial\_form. If attribute is passed in NULL or the attribute is badly broken the call returns DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY;

## 9.11 Line Table For a CU

### Functions

- DW\_API int [dwarf\\_srcfiles](#) ([Dwarf\\_Die](#) dw\_cu\_die, char \*\*\*dw\_srcfiles, [Dwarf\\_Signed](#) \*dw\_filecount, [Dwarf\\_Error](#) \*dw\_error)

*Return values easing indexing line table file numbers. Count is the real count of files array entries. Since DWARF 2,3,4 are zero origin indexes and DWARF5 and later are one origin, this function replaces dwarf\_srclines\_files\_count().*
- DW\_API int [dwarf\\_srclines\\_files\\_data\\_b](#) ([Dwarf\\_Line\\_Context](#) dw\_context, [Dwarf\\_Signed](#) dw\_index, const char \*\*dw\_name, [Dwarf\\_Unsigned](#) \*dw\_directory\_index, [Dwarf\\_Unsigned](#) \*dw\_last\_mod\_time, [Dwarf\\_Unsigned](#) \*dw\_file\_length, [Dwarf\\_Form\\_Data16](#) \*\*dw\_md5ptr, [Dwarf\\_Error](#) \*dw\_error)  
*Access data for each line table file.*
- DW\_API int [dwarf\\_srclines\\_include\\_dir\\_count](#) ([Dwarf\\_Line\\_Context](#) dw\_line\_context, [Dwarf\\_Signed](#) \*dw\_count, [Dwarf\\_Error](#) \*dw\_error)  
*Return the number of include directories in the Line Table.*
- DW\_API int [dwarf\\_srclines\\_include\\_dir\\_data](#) ([Dwarf\\_Line\\_Context](#) dw\_line\_context, [Dwarf\\_Signed](#) dw\_index, const char \*\*dw\_name, [Dwarf\\_Error](#) \*dw\_error)  
*Return the include directories in the Line Table.*
- DW\_API int [dwarf\\_srclines\\_version](#) ([Dwarf\\_Line\\_Context](#) dw\_line\_context, [Dwarf\\_Unsigned](#) \*dw\_version, [Dwarf\\_Small](#) \*dw\_table\_count, [Dwarf\\_Error](#) \*dw\_error)

- The DWARF version number of this compile-unit.*
- DW\_API int **dwarf\_linebeginstatement** (Dwarf\_Line dw\_line, Dwarf\_Bool \*dw\_returned\_bool, Dwarf\_Error \*dw\_error)  
*Read Line beginstatement register.*
  - DW\_API int **dwarf\_lineendsequence** (Dwarf\_Line dw\_line, Dwarf\_Bool \*dw\_returned\_bool, Dwarf\_Error \*dw\_error)  
*Read Line endsequence register flag.*
  - DW\_API int **dwarf\_lineno** (Dwarf\_Line dw\_line, Dwarf\_Unsigned \*dw\_returned\_linenum, Dwarf\_Error \*dw\_error)  
*Read Line line register.*
  - DW\_API int **dwarf\_line\_srcfileno** (Dwarf\_Line dw\_line, Dwarf\_Unsigned \*dw\_returned\_filenum, Dwarf\_Error \*dw\_error)  
*Read Line file register.*
  - DW\_API int **dwarf\_line\_is\_addr\_set** (Dwarf\_Line dw\_line, Dwarf\_Bool \*dw\_is\_addr\_set, Dwarf\_Error \*dw\_error)  
*Is the Dwarf\_Line address from DW\_LNS\_set\_address? This is not a line register, but it is a flag set by the library in each Dwarf\_Line, and it is derived from reading the line table.*
  - DW\_API int **dwarf\_lineaddr** (Dwarf\_Line dw\_line, Dwarf\_Addr \*dw\_returned\_addr, Dwarf\_Error \*dw\_error)  
*Return the address of the Dwarf\_Line.*
  - DW\_API int **dwarf\_lineoff\_b** (Dwarf\_Line dw\_line, Dwarf\_Unsigned \*dw\_returned\_lineoffset, Dwarf\_Error \*dw\_error)  
*Return a column number through the pointer.*
  - DW\_API int **dwarf\_linesrc** (Dwarf\_Line dw\_line, char \*\*dw\_returned\_name, Dwarf\_Error \*dw\_error)  
*Return the file name applicable to the Dwarf\_Line.*
  - DW\_API int **dwarf\_lineblock** (Dwarf\_Line dw\_line, Dwarf\_Bool \*dw\_returned\_bool, Dwarf\_Error \*dw\_error)  
*Return the basic\_block line register.*
  - DW\_API int **dwarf\_prologue\_end\_etc** (Dwarf\_Line dw\_line, Dwarf\_Bool \*dw\_prologue\_end, Dwarf\_Bool \*dw\_epilogue\_begin, Dwarf\_Unsigned \*dw\_isa, Dwarf\_Unsigned \*dw\_discriminator, Dwarf\_Error \*dw\_error)  
*Return various line table registers in one call.*
  - DW\_API int **dwarf\_linelogical** (Dwarf\_Line dw\_line, Dwarf\_Unsigned \*dw\_returned\_logical, Dwarf\_Error \*dw\_error)  
*Experimental Two-level logical Row Number Experimental two level line tables. Not explained here. When reading from an actuals table, dwarf\_line\_logical() returns the logical row number for the line.*
  - DW\_API int **dwarf\_linecontext** (Dwarf\_Line dw\_line, Dwarf\_Unsigned \*dw\_returned\_context, Dwarf\_Error \*dw\_error)  
*Experimental Two-level line tables call contexts Experimental two level line tables. Not explained here. When reading from a logicals table, dwarf\_linecontext() returns the logical row number corresponding the the calling context for an inlined call.*
  - DW\_API int **dwarf\_line\_subprogn** (Dwarf\_Line, Dwarf\_Unsigned \*, Dwarf\_Error \*)  
*Two-level line tables get subprogram number Experimental two level line tables. Not explained here. When reading from a logicals table, dwarf\_line\_subprogn() returns the index in the subprograms table of the inlined subprogram. Currently this always returns zero through the pointer as the relevant field is never updated from the default of zero.*
  - DW\_API int **dwarf\_line\_subprog** (Dwarf\_Line, char \*\*, char \*\*, Dwarf\_Unsigned \*, Dwarf\_Error \*)  
*Two-level line tables get subprog, file, line Experimental two level line tables. Not explained here. When reading from a logicals table, dwarf\_line\_subprog() returns the name of the inlined subprogram, its declaration filename, and its declaration line number, if available.*
  - DW\_API int **dwarf\_check\_lineheader\_b** (Dwarf\_Die dw\_cu\_die, int \*dw\_errcount\_out, Dwarf\_Error \*dw\_error)  
*Access to detailed line table header issues.*
  - DW\_API int **dwarf\_print\_lines** (Dwarf\_Die dw\_cu\_die, Dwarf\_Error \*dw\_error, int \*dw\_errorcount\_out)  
*Print line information in great detail.*
  - DW\_API struct Dwarf\_Printf\_Callback\_Info\_s dwarf\_register\_printf\_callback (Dwarf\_Debug dw\_dbg, struct Dwarf\_Printf\_Callback\_Info\_s \*dw\_callbackinfo)  
*For line details this records callback details.*

### 9.11.1 Detailed Description

Access to all the line table details.

### 9.11.2 Function Documentation

#### 9.11.2.1 dwarf\_check\_lineheader\_b()

```
DW_API int dwarf_check_lineheader_b (
    Dwarf_Die dw_cu_die,
    int * dw_errcount_out,
    Dwarf_Error * dw_error )
```

Access to detailed line table header issues.

Lets the caller get detailed messages about some compiler errors we detect. Calls back, the caller should do something with the messages (likely just print them). The lines passed back already have newlines.

See also

dwarf\_check\_lineheader(b)  
[Dwarf\\_Printf\\_Callback\\_Info\\_s](#)

#### Parameters

<i>dw_cu_die</i>	The CU DIE of interest
<i>dw_error</i>	If DW_DLV_ERROR this shows one error encountered.
<i>dw_errcount_out</i>	Returns the count of detected errors through the pointer.

#### Returns

DW\_DLV\_OK etc.

#### 9.11.2.2 dwarf\_line\_is\_addr\_set()

```
DW_API int dwarf_line_is_addr_set (
    Dwarf_Line dw_line,
    Dwarf_Bool * dw_is_addr_set,
    Dwarf_Error * dw_error )
```

Is the Dwarf\_Line address from DW\_LNS\_set\_address? This is not a line register, but it is a flag set by the library in each Dwarf\_Line, and it is derived from reading the line table.

#### Parameters

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_is_addr_set</i>	On success it sets the flag to TRUE or FALSE.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.11.2.3 dwarf\_line\_srcfileno()**

```
DW_API int dwarf_line_srcfileno (
    Dwarf_Line dw_line,
    Dwarf_Unsigned * dw_returned_filenum,
    Dwarf_Error * dw_error )
```

Read Line file register.

[Line Table Registers](#)**Parameters**

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_returned_filenum</i>	On success it sets the value to the file number from the Dwarf_Line file register
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.11.2.4 dwarf\_lineaddr()**

```
DW_API int dwarf_lineaddr (
    Dwarf_Line dw_line,
    Dwarf_Addr * dw_returned_addr,
    Dwarf_Error * dw_error )
```

Return the address of the Dwarf\_Line.

[Line Table Registers](#)**Parameters**

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_returned_addr</i>	On success it sets the value to the value of the address register in the Dwarf_Line.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.11.2.5 dwarf\_linebeginstatement()**

```
DW_API int dwarf_linebeginstatement (
    Dwarf_Line dw_line,
```

```
Dwarf_Bool * dw_returned_bool,  
Dwarf_Error * dw_error )
```

Read Line beginstatement register.

#### Line Table Registers

##### Parameters

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_returned_bool</i>	On success it sets the value TRUE (if the dw_line has the is_stmt register set) and FALSE if is_stmt is not set.
<i>dw_error</i>	The usual error pointer.

##### Returns

DW\_DLV\_OK if it succeeds.

#### 9.11.2.6 dwarf\_lineblock()

```
DW_API int dwarf_lineblock (  
    Dwarf_Line dw_line,  
    Dwarf_Bool * dw_returned_bool,  
    Dwarf_Error * dw_error )
```

Return the basic\_block line register.

#### Line Table Registers

##### Parameters

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_returned_bool</i>	On success it sets the flag to TRUE or FALSE from the basic_block register in the line table.
<i>dw_error</i>	The usual error pointer.

##### Returns

DW\_DLV\_OK if it succeeds.

#### 9.11.2.7 dwarf\_lineendsequence()

```
DW_API int dwarf_lineendsequence (  
    Dwarf_Line dw_line,  
    Dwarf_Bool * dw_returned_bool,  
    Dwarf_Error * dw_error )
```

Read Line endsequence register flag.

#### Line Table Registers

## Parameters

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_returned_bool</i>	On success it sets the value TRUE (if the dw_line has the end_sequence register set) and FALSE if end_sequence is not set.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds.

## 9.11.2.8 dwarf\_lineno()

```
DW_API int dwarf_lineno (
    Dwarf_Line dw_line,
    Dwarf_Unsigned * dw_returned_linenum,
    Dwarf_Error * dw_error )
```

Read Line line register.

[Line Table Registers](#)

## Parameters

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_returned_linenum</i>	On success it sets the value to the line number from the Dwarf_Line line register
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds.

## 9.11.2.9 dwarf\_lineoff\_b()

```
DW_API int dwarf_lineoff_b (
    Dwarf_Line dw_line,
    Dwarf_Unsigned * dw_returned_lineoffset,
    Dwarf_Error * dw_error )
```

Return a column number through the pointer.

[Line Table Registers](#)

## Parameters

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_returned_lineoffset</i>	On success it sets the value to the column register from the Dwarf_Line.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.11.2.10 dwarf\_linesrc()**

```
DW_API int dwarf_linesrc (
    Dwarf_Line dw_line,
    char ** dw_returned_name,
    Dwarf_Error * dw_error )
```

Return the file name applicable to the Dwarf\_Line.

[Line Table Registers](#)**Parameters**

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_returned_name</i>	On success it reads the file register and finds constructs a file name from a directory and filename there and and returns a pointer to that string through the pointer. It is necessary to deallocate the returned string with <code>dwarf_dealloc(dbg, lsrc_filename, DW_DLA_STRING)</code> ; ( Older versions of this function incorrectly said not to free() or <code>dwarf_dealloc()</code> . )
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**See also**

[Using dwarf\\_srclines\\_b\(\) and linecontext](#)

**9.11.2.11 dwarf\_print\_lines()**

```
DW_API int dwarf_print_lines (
    Dwarf_Die dw_cu_die,
    Dwarf_Error * dw_error,
    int * dw_errorcount_out )
```

Print line information in great detail.

`dwarf_print_lines` lets the caller prints line information for a CU in great detail. Does not use `printf`. Instead it calls back to the application using a function pointer once per line-to-print. The lines passed back already have any needed newlines.

`dwarfdump` uses this function for verbose printing of line table data.

Failing to call the [dwarf\\_register\\_printf\\_callback\(\)](#) function will prevent the lines from being passed back but such omission is not an error. The same function, but focused on checking for errors is [dwarf\\_check\\_lineheader\\_b\(\)](#).

**See also**

[Dwarf\\_Printf\\_Callback\\_Info\\_s](#)

## Parameters

<i>dw_cu_die</i>	The CU DIE of interest
<i>dw_error</i>	
<i>dw_errorcount_out</i>	

## Returns

DW\_DLV\_OK etc.

9.11.2.12 `dwarf_prologue_end_etc()`

```
DW_API int dwarf_prologue_end_etc (
    Dwarf_Line dw_line,
    Dwarf_Bool * dw_prologue_end,
    Dwarf_Bool * dw_epilogue_begin,
    Dwarf_Unsigned * dw_isa,
    Dwarf_Unsigned * dw_discriminator,
    Dwarf_Error * dw_error )
```

Return various line table registers in one call.

## Line Table Registers

## Parameters

<i>dw_line</i>	The Dwarf_Line of interest.
<i>dw_prologue_end</i>	On success it sets the flag to TRUE or FALSE from the prologue_end register in the line table.
<i>dw_epilogue_begin</i>	On success it sets the flag to TRUE or FALSE from the epilogue_begin register in the line table.
<i>dw_isa</i>	On success it sets the value to the value of from the isa register in the line table.
<i>dw_discriminator</i>	On success it sets the value to the value of from the discriminator register in the line table.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds.

9.11.2.13 `dwarf_register_printf_callback()`

```
DW_API struct Dwarf_Printf_Callback_Info_s dwarf_register_printf_callback (
    Dwarf_Debug dw_dbg,
    struct Dwarf_Printf_Callback_Info_s * dw_callbackinfo )
```

For line details this records callback details.

Not usually needed. It is a way to check (while using the library) what callback data is in use or to update that callback data.

See also

[Dwarf\\_Printf\\_Callback\\_Info\\_s](#)

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_callbackinfo</i>	If non-NULL pass in a pointer to your instance of struct <a href="#">Dwarf_Printf_Callback_Info_s</a> with all the fields filled in.

#### Returns

If dw\_callbackinfo NULL it returns a copy of the current [Dwarf\\_Printf\\_Callback\\_Info\\_s](#) for dw\_dbg. Otherwise it returns the previous contents of the struct.

#### 9.11.2.14 dwarf\_srcfiles()

```
DW_API int dwarf_srcfiles (
    Dwarf_Die dw_cu_die,
    char *** dw_srcfiles,
    Dwarf_Signed * dw_filecount,
    Dwarf_Error * dw_error )
```

The list of source files from the line table header.

The array returned by this function applies to a single compilation unit (CU).

The returned array is indexed from 0 (zero) to dw\_filecount-1 when the function returns DW\_DLV\_OK.

In referencing the array via a file-number from a **DW\_AT\_decl\_file** or **DW\_AT\_call\_file** attribute one needs to know if the CU is DWARF5 or not.

Line Table Version numbers match compilation unit version numbers except that an experimental line table with line table version 0xfe06 has sometimes been used with DWARF4.

For DWARF5:

The file-number from a **DW\_AT\_decl\_file** or **DW\_AT\_call\_file** is the proper index into the array of string pointers.

For DWARF2,3,4, including experimental line table version 0xfe06 and a file-number from a **DW\_AT\_decl\_file** or **DW\_AT\_call\_file**:

1. If the file-number is zero there is no file name to find.
2. Otherwise subtract one(1) from the file-number and use the new value as the index into the array of string pointers.

The name strings returned are each assembled in the following way by [dwarf\\_srcfiles\(\)](#):

1. The file number denotes a name in the line table header.
2. If the name is not a full path (i.e. not starting with / in posix/linux/Macos) then prepend the appropriate directory string from the line table header.
3. If the name is still not a full path then prepend the content of the DW\_AT\_comp\_dir attribute of the CU DIE.

To retrieve the line table version call [dwarf\\_srclines\\_b\(\)](#) and [dwarf\\_srclines\\_version\(\)](#).

See also

[Using dwarf\\_srclines\\_b\(\)](#)

## Parameters

<i>dw_cu_die</i>	The CU DIE in this CU.
<i>dw_srcfiles</i>	On success allocates an array of pointers to strings and for each such, computes the fullest path possible given the CU DIE data for each file name listed in the line table header.
<i>dw_filecount</i>	On success returns the number of entries in the array of pointers to strings. The number returned is non-negative.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds. If there is no `.debug_line[.dwo]` returns DW\_DLV\_NO\_ENTRY.

## See also

[Using dwarf\\_srcfiles\(\)](#)

## 9.11.2.15 dwarf\_srclines\_b()

```
DW_API int dwarf_srclines_b (
    Dwarf_Die dw_cudie,
    Dwarf_Unsigned * dw_version_out,
    Dwarf_Small * dw_table_count,
    Dwarf_Line_Context * dw_linecontext,
    Dwarf_Error * dw_error )
```

Initialize Dwarf\_Line\_Context for line table access.

Returns Dwarf\_Line\_Context pointer, needed for access to line table data. Returns the line table version number (needed to use [dwarf\\_srcfiles\(\)](#) properly).

## See also

[Using dwarf\\_srclines\\_b\(\)](#)

[Using dwarf\\_srclines\\_b\(\) and linecontext](#)

## Parameters

<i>dw_cudie</i>	The Compilation Unit (CU) DIE of interest.
<i>dw_version_out</i>	The DWARF Line Table version number (Standard: 2,3,4, or 5) Version 0xf006 is an experimental (two-level) line table.
<i>dw_table_count</i>	Zero or one means this is a normal DWARF line table. Two means this is an experimental two-level line table.
<i>dw_linecontext</i>	On success sets the pointer to point to an opaque structure usable for further queries.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds.

### 9.11.2.16 dwarf\_srclines\_comp\_dir()

```
DW_API int dwarf_srclines_comp_dir (
    Dwarf_Line_Context dw_context,
    const char ** dw_compilation_directory,
    Dwarf_Error * dw_error )
```

Compilation Directory name for the CU.

Do not free() or dealloc the string, it is in a dwarf section.

#### Parameters

<i>dw_context</i>	The Line Context of interest.
<i>dw_compilation_directory</i>	On success returns a pointer to a string identifying the compilation directory of the CU.
<i>dw_error</i>	The usual error pointer.

#### Returns

DW\_DLX\_OK if it succeeds.

### 9.11.2.17 dwarf\_srclines\_dealloc\_b()

```
DW_API void dwarf_srclines_dealloc_b (
    Dwarf_Line_Context dw_context )
```

Dealloc the memory allocated by dwarf\_srclines\_b.

The way to deallocate (free) a Dwarf\_Line\_Context

#### Parameters

<i>dw_context</i>	The context to be deallocated (freed). On return the pointer passed in is stale and calling applications should zero the pointer.
-------------------	---

### 9.11.2.18 dwarf\_srclines\_files\_data\_b()

```
DW_API int dwarf_srclines_files_data_b (
    Dwarf_Line_Context dw_context,
    Dwarf_Signed dw_index_in,
    const char ** dw_name,
    Dwarf_Unsigned * dw_directory_index,
    Dwarf_Unsigned * dw_last_mod_time,
    Dwarf_Unsigned * dw_file_length,
    Dwarf_Form_Data16 ** dw_md5ptr,
    Dwarf_Error * dw_error )
```

Access data for each line table file.

Has the md5ptr field so cases where DW\_LNCT\_MD5 is present can return pointer to the MD5 value. With DWARF 5 index starts with 0. [dwarf\\_srclines\\_files\\_indexes\(\)](#) makes indexing through the files easy.

See also

[dwarf\\_srclines\\_files\\_indexes](#)

Using [dwarf\\_srclines\\_b\(\)](#)

#### Parameters

<i>dw_context</i>	The line context of interest.
<i>dw_index_in</i>	The entry of interest. Callers should index as <i>dw_baseindex</i> through <i>dw_endindex</i> -1.
<i>dw_name</i>	If <i>dw_name</i> non-null on success returns The file name in the line table header through the pointer.
<i>dw_directory_index</i>	If <i>dw_directory_index</i> non-null on success returns the directory number in the line table header through the pointer.
<i>dw_last_mod_time</i>	If <i>dw_last_mod_time</i> non-null on success returns the directory last modification date/time through the pointer.
<i>dw_file_length</i>	If <i>dw_file_length</i> non-null on success returns the file length recorded in the line table through the pointer.
<i>dw_md5ptr</i>	If <i>dw_md5ptr</i> non-null on success returns a pointer to the 16byte MD5 hash of the file through the pointer. If there is no md5 value present it returns 0 through the pointer.
<i>dw_error</i>	The usual error pointer.

#### Returns

DW\_DLV\_OK if it succeeds.

#### 9.11.2.19 dwarf\_srclines\_files\_indexes()

```
DW_API int dwarf_srclines_files_indexes (
    Dwarf_Line_Context dw_context,
    Dwarf_Signed * dw_baseindex,
    Dwarf_Signed * dw_count,
    Dwarf_Signed * dw_endindex,
    Dwarf_Error * dw_error )
```

Return values easing indexing line table file numbers. Count is the real count of files array entries. Since DWARF 2,3,4 are zero origin indexes and DWARF5 and later are one origin, this function replaces [dwarf\\_srclines\\_files\\_count\(\)](#).

#### Parameters

<i>dw_context</i>	The line context of interest.
<i>dw_baseindex</i>	On success returns the base index of valid file indexes. With DWARF2,3,4 the value is 1. With DWARF5 the value is 0.
<i>dw_count</i>	On success returns the real count of entries.
<i>dw_endindex</i>	On success returns value such that callers should index as <i>dw_baseindex</i> through <i>dw_endindex</i> -1.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**See also**

[Using dwarf\\_srclines\\_b\(\)](#)

**9.11.2.20 dwarf\_srclines\_from\_linecontext()**

```
DW_API int dwarf_srclines_from_linecontext (
    Dwarf_Line_Context dw_linecontext,
    Dwarf_Line ** dw_linebuf,
    Dwarf_Signed * dw_linecount,
    Dwarf_Error * dw_error )
```

Access source lines from line context.

Provides access to Dwarf\_Line data from a Dwarf\_Line\_Context on a standard line table.

**Parameters**

<i>dw_linecontext</i>	The line context of interest.
<i>dw_linebuf</i>	On success returns an array of pointers to Dwarf_Line.
<i>dw_linecount</i>	On success returns the count of entries in dw_linebuf. If dw_linecount is returned as zero this is a line table with no lines.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.11.2.21 dwarf\_srclines\_include\_dir\_count()**

```
DW_API int dwarf_srclines_include_dir_count (
    Dwarf_Line_Context dw_line_context,
    Dwarf_Signed * dw_count,
    Dwarf_Error * dw_error )
```

Return the number of include directories in the Line Table.

**Parameters**

<i>dw_line_context</i>	The line context of interest.
<i>dw_count</i>	On success returns the count of directories. How to use this depends on the line table version number.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds.

## See also

[dwarf\\_srclines\\_include\\_dir\\_data](#)

## 9.11.2.22 dwarf\_srclines\_include\_dir\_data()

```
DW_API int dwarf_srclines_include_dir_data (
    Dwarf_Line_Context dw_line_context,
    Dwarf_Signed dw_index,
    const char ** dw_name,
    Dwarf_Error * dw_error )
```

Return the include directories in the Line Table.

## Parameters

<i>dw_line_context</i>	The line context of interest.
<i>dw_index</i>	Pass in an index to the line context list of include directories. If the line table is version 2,3, or 4, the valid indexes are 1 through dw_count. If the line table is version 5 the valid indexes are 0 through dw_count-1.
<i>dw_name</i>	On success it returns a pointer to a directory name. Do not free/deallocate the string.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds.

## See also

[dwarf\\_srclines\\_include\\_dir\\_count](#)

## 9.11.2.23 dwarf\_srclines\_subprog\_count()

```
DW_API int dwarf_srclines_subprog_count (
    Dwarf_Line_Context dw_context,
    Dwarf_Signed * dw_count,
    Dwarf_Error * dw_error )
```

Subprog count: Part of the two-level line table extension.

A non-standard table. The actual meaning of subprog count left undefined here.

## Parameters

<i>dw_context</i>	The Dwarf_Line_Context of interest.
<i>dw_count</i>	On success returns the two-level line table subprogram array size in this line context.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.11.2.24 dwarf\_srclines\_subprog\_data()**

```
DW_API int dwarf_srclines_subprog_data (
    Dwarf_Line_Context dw_context,
    Dwarf_Signed dw_index,
    const char ** dw_name,
    Dwarf_Unsigned * dw_decl_file,
    Dwarf_Unsigned * dw_decl_line,
    Dwarf_Error * dw_error )
```

Retrieve data from the line table subprog array.

A non-standard table. Not defined here.

**Parameters**

<i>dw_context</i>	The Dwarf_Line_Context of interest.
<i>dw_index</i>	The item to retrieve. Valid indexes are 1 through dw_count.
<i>dw_name</i>	On success returns a pointer to the subprog name.
<i>dw_decl_file</i>	On success returns a file number through the pointer.
<i>dw_decl_line</i>	On success returns a line number through the pointer.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.11.2.25 dwarf\_srclines\_table\_offset()**

```
DW_API int dwarf_srclines_table_offset (
    Dwarf_Line_Context dw_context,
    Dwarf_Unsigned * dw_offset,
    Dwarf_Error * dw_error )
```

Return the srclines table offset.

The offset is in the relevant .debug\_line or .debug\_line.dwo section (and in a split dwarf package file includes the base line table offset).

**Parameters**

<i>dw_context</i>	
<i>dw_offset</i>	On success returns the section offset of the dw_context.
<i>dw_error</i>	The usual error pointer.

**Returns**

DW\_DLV\_OK if it succeeds.

**9.11.2.26 dwarf\_srclines\_two\_level\_from\_linecontext()**

```
DW_API int dwarf_srclines_two_level_from_linecontext (
    Dwarf_Line_Context dw_context,
    Dwarf_Line ** dw_linebuf,
    Dwarf_Signed * dw_linecount,
    Dwarf_Line ** dw_linebuf_actuais,
    Dwarf_Signed * dw_linecount_actuais,
    Dwarf_Error * dw_error )
```

Returns line table counts and data.

Works for DWARF2,3,4,5 and for experimental two-level line tables. A single level table will have \*linebuf\_actuais and \*linecount\_actuais set to 0.

Two-level line tables are non-standard and not documented further. For standard (one-level) tables, it will return the single table through dw\_linebuf, and the value returned through dw\_linecount\_actuais will be 0.

People not using these two-level tables should dwarf\_srclines\_from\_linecontext instead.

**9.11.2.27 dwarf\_srclines\_version()**

```
DW_API int dwarf_srclines_version (
    Dwarf_Line_Context dw_line_context,
    Dwarf_Unsigned * dw_version,
    Dwarf_Small * dw_table_count,
    Dwarf_Error * dw_error )
```

The DWARF version number of this compile-unit.

The .debug\_lines[.dwo] table count informs about the line table version and the type of line table involved.

Meaning of the value returned via dw\_table\_count:

- 0 The table is a header with no lines.
- 1 The table is a standard line table.
- 2 The table is an experimental line table.

**Parameters**

<i>dw_line_context</i>	The Line Context of interest.
<i>dw_version</i>	On success, returns the line table version through the pointer.
<i>dw_table_count</i>	On success, returns the tablecount through the pointer. If the table count is zero the line table is a header with no lines. If the table count is 1 this is a standard line table. If the table count is this is an experimental two-level line table.
<i>dw_error</i>	The usual error pointer.

## Returns

DW\_DLV\_OK if it succeeds.

## 9.12 Ranges: code addresses in DWARF3-4

### Functions

- DW\_API int [dwarf\\_get\\_ranges\\_b](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Off](#) dw\_rangesoffset, [Dwarf\\_Die](#) dw\_die, [Dwarf\\_Off](#) \*dw\_return\_realoffset, [Dwarf\\_Ranges](#) \*\*dw\_rangesbuf, [Dwarf\\_Signed](#) \*dw\_rangecount, [Dwarf\\_Unsigned](#) \*dw\_bytecount, [Dwarf\\_Error](#) \*dw\_error)  
*Access to code ranges from a CU or just reading through the raw .debug\_ranges section.*
- DW\_API void [dwarf\\_dealloc\\_ranges](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Ranges](#) \*dw\_rangesbuf, [Dwarf\\_Signed](#) dw\_rangecount)  
*Dealloc the array dw\_rangesbuf.*
- DW\_API int [dwarf\\_get\\_ranges\\_baseaddress](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Die](#) dw\_die, [Dwarf\\_Bool](#) \*dw\_known\_base, [Dwarf\\_Unsigned](#) \*dw\_baseaddress, [Dwarf\\_Bool](#) \*dw\_at\_ranges\_offset\_present, [Dwarf\\_Unsigned](#) \*dw\_at\_ranges\_offset, [Dwarf\\_Error](#) \*dw\_error)  
*Find ranges base address.*

### 9.12.1 Detailed Description

In DWARF3 and DWARF4 the DW\_AT\_ranges attribute provides an offset into the .debug\_ranges section, which contains code address ranges.

## See also

[Dwarf\\_Ranges](#)

DWARF3 and DWARF4. DW\_AT\_ranges with an unsigned constant FORM (DWARF3) or DW\_FORM\_sec\_offset(↵ DWARF4).

### 9.12.2 Function Documentation

#### 9.12.2.1 dwarf\_dealloc\_ranges()

```
DW_API void dwarf_dealloc_ranges (
    Dwarf_Debug dw_dbg,
    Dwarf_Ranges * dw_rangesbuf,
    Dwarf_Signed dw_rangecount )
```

Dealloc the array dw\_rangesbuf.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_rangesbuf</i>	The dw_rangesbuf pointer returned by dwarf_get_ranges_b
<i>dw_rangecount</i>	The dw_rangecount returned by dwarf_get_ranges_b

### 9.12.2.2 dwarf\_get\_ranges\_b()

```
DW_API int dwarf_get_ranges_b (
    Dwarf_Debug dw_dbg,
    Dwarf_Off dw_rangesoffset,
    Dwarf_Die dw_die,
    Dwarf_Off * dw_return_realoffset,
    Dwarf_Ranges ** dw_rangesbuf,
    Dwarf_Signed * dw_rangecount,
    Dwarf_Unsigned * dw_bytecount,
    Dwarf_Error * dw_error )
```

Access to code ranges from a CU or just reading through the raw .debug\_ranges section.

Adds return of the dw\_realoffset to accommodate DWARF4 GNU split-dwarf, where the ranges could be in the tieddbg (meaning the real executable, a.out, not in a dwp). DWARF4 split-dwarf is an extension, not standard DWARF4.

If printing all entries in the section pass in an initial dw\_rangesoffset of zero and dw\_die of NULL. Then increment dw\_rangesoffset by dw\_bytecount and call again to get the next batch of ranges. With a specific option dwarfdump can do this. This not a normal thing to do!

See also

[Example getting .debug\\_ranges data](#)

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest
<i>dw_rangesoffset</i>	The offset to read from in the section.
<i>dw_die</i>	Pass in the DIE whose DW_AT_ranges brought us to ranges.
<i>dw_return_realoffset</i>	The actual offset in the section actually read. In a tieddbg dwp DWARF4 extension object the base offset is added to dw_rangesoffset and returned here.
<i>dw_rangesbuf</i>	A pointer to an array of structs is returned here. The struct contents are the raw values in the section.
<i>dw_rangecount</i>	The count of structs in the array is returned here.
<i>dw_bytecount</i>	The number of bytes in the .debug_ranges section applying to the returned array. This makes possible just marching through the section by offset.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.12.2.3 dwarf\_get\_ranges\_baseaddress()

```
DW_API int dwarf_get_ranges_baseaddress (
    Dwarf_Debug dw_dbg,
    Dwarf_Die dw_die,
    Dwarf_Bool * dw_known_base,
    Dwarf_Unsigned * dw_baseaddress,
```

```
Dwarf_Bool * dw_at_ranges_offset_present,
Dwarf_Unsigned * dw_at_ranges_offset,
Dwarf_Error * dw_error )
```

Find ranges base address.

The function allows callers to calculate actual address from .debug\_ranges data in a simple and efficient way by returning the CU DIE ranges baseaddress.

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_die</i>	Pass in any non-null valid Dwarf_Die to find the applicable .debug_ranges base address. The dw_die need not be a CU-DIE. A null dw_die is allowed.
<i>dw_known_base</i>	if dw_die is non-null and there is a known base address for the CU DIE that (a DW_at_low_pc in the CU DIE) dw_known_base will be set TRUE, Otherwise the value FALSE will be returned through dw_known_base.
<i>dw_baseaddress</i>	if dw_known_base is returned as TRUE then dw_baseaddress will be set with the correct pc value. Otherwise zero will be set through dw_baseaddress.
<i>dw_at_ranges_offset_present</i>	Set to 1 (TRUE) if dw_die has the attribute DW_AT_ranges.
<i>dw_at_ranges_offset</i>	Set to the value of DW_AT_ranges attribute of dw_die if dw_at_ranges_offset_present was set to TRUE. The offset is of the beginning of the .debug_ranges section range lists applying to this DIE.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK or DW\_DLV\_ERROR. Never returns DW\_DLV\_NO\_ENTRY.

## 9.13 Rnglists: code addresses in DWARF5

#### Functions

- DW\_API int [dwarf\\_rnglists\\_get\\_rle\\_head](#) (Dwarf\_Attribute dw\_attr, Dwarf\_Half dw\_theform, Dwarf\_Unsigned dw\_index\_or\_offset\_value, Dwarf\_Rnglists\_Head \*dw\_head\_out, Dwarf\_Unsigned \*dw\_count\_of\_entries↵\_in\_head, Dwarf\_Unsigned \*dw\_global\_offset\_of\_rle\_set, Dwarf\_Error \*dw\_error)

*Access to raw rnglists range data.*

## 9.13.1 Detailed Description

Used in DWARF5 to define valid address ranges for code.

DW\_FORM\_rnglistx or DW\_AT\_ranges with DW\_FORM\_sec\_offset

## 9.13.2 Function Documentation

### 9.13.2.1 dwarf\_dealloc\_rnglists\_head()

```
DW_API void dwarf_dealloc_rnglists_head (
    Dwarf_Rnglists_Head dw_head )
```

Dealloc a Dwarf\_Rnglists\_Head.

#### Parameters

<code>dw_head</code>	dealloc all the memory associated with dw_head. The caller should then immediately set the pointer to zero/NULL as it is stale.
----------------------	---

### 9.13.2.2 dwarf\_get\_rnglist\_context\_basics()

```
DW_API int dwarf_get_rnglist_context_basics (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_index,
    Dwarf_Unsigned * dw_header_offset,
    Dwarf_Small * dw_offset_size,
    Dwarf_Small * dw_extension_size,
```

```

unsigned int * dw_version,
Dwarf_Small * dw_address_size,
Dwarf_Small * dw_segment_selector_size,
Dwarf_Unsigned * dw_offset_entry_count,
Dwarf_Unsigned * dw_offset_of_offset_array,
Dwarf_Unsigned * dw_offset_of_first_rangeentry,
Dwarf_Unsigned * dw_offset_past_last_rangeentry,
Dwarf_Error * dw_error )

```

Access to rnglists header data.

This returns, independent of any DIES or CUs information on the .debug\_rnglists headers present in the section.

We do not document the details here. See the DWARF5 standard.

Enables printing of details about the Range List Table Headers, one header per call. Index starting at 0. Returns DW\_DLV\_NO\_ENTRY if index is too high for the table. A .debug\_rnglists section may contain any number of Range List Table Headers with their details.

### 9.13.2.3 dwarf\_get\_rnglist\_head\_basics()

```

DW_API int dwarf_get_rnglist_head_basics (
    Dwarf_Rnglists_Head dw_head,
    Dwarf_Unsigned * dw_rle_count,
    Dwarf_Unsigned * dw_rnglists_version,
    Dwarf_Unsigned * dw_rnglists_index_returned,
    Dwarf_Unsigned * dw_bytes_total_in_rle,
    Dwarf_Half * dw_offset_size,
    Dwarf_Half * dw_address_size,
    Dwarf_Half * dw_segment_selector_size,
    Dwarf_Unsigned * dw_overall_offset_of_this_context,
    Dwarf_Unsigned * dw_total_length_of_this_context,
    Dwarf_Unsigned * dw_offset_table_offset,
    Dwarf_Unsigned * dw_offset_table_entrycount,
    Dwarf_Bool * dw_rnglists_base_present,
    Dwarf_Unsigned * dw_rnglists_base,
    Dwarf_Bool * dw_rnglists_base_address_present,
    Dwarf_Unsigned * dw_rnglists_base_address,
    Dwarf_Bool * dw_rnglists_debug_addr_base_present,
    Dwarf_Unsigned * dw_rnglists_debug_addr_base,
    Dwarf_Error * dw_error )

```

Access to internal data on rngelists.

Returns detailed data from a Dwarf\_Rnglists\_Head Since this is primarily internal data we don't describe the details of the returned fields here.

### 9.13.2.4 dwarf\_get\_rnglist\_offset\_index\_value()

```

DW_API int dwarf_get_rnglist_offset_index_value (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_context_index,
    Dwarf_Unsigned dw_offsetentry_index,
    Dwarf_Unsigned * dw_offset_value_out,
    Dwarf_Unsigned * dw_global_offset_value_out,
    Dwarf_Error * dw_error )

```

Retrieve the section offset of a rnglist.

Can be used to access raw rnglist data. Not used by most callers. See DWARF5 Section 7.28 Range List Table  
Page 242

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_context_index</i>	Begin this at zero.
<i>dw_offsetentry_index</i>	Begin this at zero.
<i>dw_offset_value_out</i>	On success returns the rangelist entry offset within the rangelist set.
<i>dw_global_offset_value_out</i>	On success returns the rangelist entry offset within rnglist section.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc. If there are no rnglists at all, or if one of the above index values is too high to be valid it returns DW\_DLV\_NO\_ENTRY.

## 9.13.2.5 dwarf\_get\_rnglist\_rle()

```
DW_API int dwarf_get_rnglist_rle (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_contextnumber,
    Dwarf_Unsigned dw_entry_offset,
    Dwarf_Unsigned dw_endoffset,
    unsigned int * dw_entrylen,
    unsigned int * dw_entry_kind,
    Dwarf_Unsigned * dw_entry_operand1,
    Dwarf_Unsigned * dw_entry_operand2,
    Dwarf_Error * dw_error )
```

Access to raw rnglists range data.

Describes the actual raw data recorded in a particular range entry.

We do not describe all these fields for now, the raw values are mostly useful for people debugging compiler-generated DWARF.

## 9.13.2.6 dwarf\_get\_rnglists\_entry\_fields\_a()

```
DW_API int dwarf_get_rnglists_entry_fields_a (
    Dwarf_Rnglists_Head dw_head,
    Dwarf_Unsigned dw_entrynum,
    unsigned int * dw_entrylen,
    unsigned int * dw_rle_value_out,
    Dwarf_Unsigned * dw_raw1,
    Dwarf_Unsigned * dw_raw2,
    Dwarf_Bool * dw_debug_addr_unavailable,
    Dwarf_Unsigned * dw_cooked1,
    Dwarf_Unsigned * dw_cooked2,
    Dwarf_Error * dw_error )
```

Access rnglist entry details.

See also

[Accessing rnglists section](#)

## Parameters

<i>dw_head</i>	The Dwarf_Rnglists_Head of interest.
<i>dw_entrynum</i>	Valid values are 0 through dw_count_of_entries_in_head-1.
<i>dw_entrylen</i>	On success returns the length in bytes of this individual entry.
<i>dw_rle_value_out</i>	On success returns the RLE value of the entry, such as DW_RLE_startx_endx. This determines which of dw_raw1 and dw_raw2 contain meaningful data.
<i>dw_raw1</i>	On success returns a value directly recorded in the rangelist entry if that applies to this rle.
<i>dw_raw2</i>	On success returns a value directly recorded in the rangelist entry if that applies to this rle.
<i>dw_debug_addr_unavailable</i>	On success returns a flag. If the .debug_addr section is required but absent or unavailable the flag is set to TRUE. Otherwise sets the flag FALSE.
<i>dw_cooked1</i>	On success returns (if appropriate) the dw_raw1 value turned into a valid address.
<i>dw_cooked2</i>	On success returns (if appropriate) the dw_raw2 value turned into a valid address. Ignore the value if dw_debug_addr_unavailable is set.
<i>dw_error</i>	The usual error detail return pointer. Ignore the value if dw_debug_addr_unavailable is set.

## Returns

Returns DW\_DLV\_OK etc.

## 9.13.2.7 dwarf\_load\_rnglists()

```
DW_API int dwarf_load_rnglists (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned * dw_rnglists_count,
    Dwarf_Error * dw_error )
```

Loads all .debug\_rnglists headers.

Loads all the rnglists headers and returns DW\_DLV\_NO\_ENTRY if the section is missing or empty. Intended to be done quite early. It is automatically done if anything needing CU or DIE information is called, so it is not necessary for you to call this in any normal situation.

## See also

[Accessing accessing raw rnglist](#)

Doing it more than once is never necessary or harmful. There is no deallocation call made visible, deallocation happens when [dwarf\\_finish\(\)](#) is called.

## Parameters

<i>dw_dbg</i>	
<i>dw_rnglists_count</i>	On success it returns the number of rnglists headers in the section through dw_rnglists_count.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc. If the section does not exist the function returns DW\_DLV\_OK.

## 9.13.2.8 dwarf\_rnglists\_get\_rle\_head()

```
DW_API int dwarf_rnglists_get_rle_head (
    Dwarf_Attribute dw_attr,
    Dwarf_Half dw_theform,
    Dwarf_Unsigned dw_index_or_offset_value,
    Dwarf_Rnglists_Head * dw_head_out,
    Dwarf_Unsigned * dw_count_of_entries_in_head,
    Dwarf_Unsigned * dw_global_offset_of_rle_set,
    Dwarf_Error * dw_error )
```

Get Access to DWARF5 rnglists.

Opens a Dwarf\_Rnglists\_Head to access a set of DWARF5 rngelists .debug\_rnglists DW\_FORM\_sec\_offset DW↔\_FORM\_rnglistx (DW\_AT\_ranges in DWARF5).

## See also

[Accessing rnglists section](#)

## Parameters

<i>dw_attr</i>	The attribute referring to .debug_rnglists
<i>dw_theform</i>	The form number, DW_FORM_sec_offset or DW_FORM_rnglistx.
<i>dw_index_or_offset_value</i>	If the form is an index, pass it here. If the form is an offset, pass that here.
<i>dw_head_out</i>	On success creates a record owning the rnglists data for this attribute.
<i>dw_count_of_entries_in_head</i>	On success this is set to the number of entry in the rnglists for this attribute.
<i>dw_global_offset_of_rle_set</i>	On success set to the global offset of the rnglists in the rnglists section.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

## 9.14 Locations of data: DWARF2-DWARF5

## Macros

*Return basic data about a loclists context entry.*

### 9.14.1 Detailed Description

### 9.14.2 Function Documentation

#### 9.14.2.1 dwarf\_dealloc\_loc\_head\_c()

```
DW_API void dwarf_dealloc_loc_head_c (
    Dwarf_Loc_Head_c dw_head )
```

Dealloc (free) all memory allocated for Dwarf\_Loc\_Head\_c.

##### Parameters

<i>dw_head</i>	A head pointer.
----------------	-----------------

The caller should zero the passed-in pointer on return as it is stale at that point.

#### 9.14.2.2 dwarf\_get\_location\_op\_value\_c()

```
DW_API int dwarf_get_location_op_value_c (
    Dwarf_Locdesc_c dw_locdesc,
    Dwarf_Unsigned dw_index,
    Dwarf_Small * dw_operator_out,
    Dwarf_Unsigned * dw_operand1,
    Dwarf_Unsigned * dw_operand2,
    Dwarf_Unsigned * dw_operand3,
    Dwarf_Unsigned * dw_offset_for_branch,
    Dwarf_Error * dw_error )
```

Get the raw values from a single location operation.

##### Parameters

<i>dw_locdesc</i>	Pass in a valid Dwarf_Locdesc_c.
<i>dw_index</i>	Pass in the operator index. zero through dw_locexpr_op_count_out-1.
<i>dw_operator_out</i>	On success returns the DW_OP operator, such as DW_OP_plus .
<i>dw_operand1</i>	On success returns the value of the operand or zero.
<i>dw_operand2</i>	On success returns the value of the operand or zero.
<i>dw_operand3</i>	On success returns the value of the operand or zero.
<i>dw_offset_for_branch</i>	On success returns The byte offset of the operator within the entire expression. Useful for checking the correctness of operators that branch..
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

## 9.14.2.3 dwarf\_get\_locdesc\_entry\_d()

```
DW_API int dwarf_get_locdesc_entry_d (
    Dwarf_Loc_Head_c dw_loclist_head,
    Dwarf_Unsigned dw_index,
    Dwarf_Small * dw_lle_value_out,
    Dwarf_Unsigned * dw_rawlowpc,
    Dwarf_Unsigned * dw_rawhipc,
    Dwarf_Bool * dw_debug_addr_unavailable,
    Dwarf_Addr * dw_lowpc_cooked,
    Dwarf_Addr * dw_hipc_cooked,
    Dwarf_Unsigned * dw_locexpr_op_count_out,
    Dwarf_Locdesc_c * dw_locentry_out,
    Dwarf_Small * dw_loclist_source_out,
    Dwarf_Unsigned * dw_expression_offset_out,
    Dwarf_Unsigned * dw_locdesc_offset_out,
    Dwarf_Error * dw_error )
```

Retrieve the details(\_d) of a location expression.

Cooked value means the addresses from the location description after base values applied, so they are actual addresses. `debug_addr_unavailable` non-zero means the record from a Split Dwarf skeleton unit could not be accessed from the .dwo section or dwp object so the cooked values could not be calculated.

## Parameters

<i>dw_loclist_head</i>	A loclist head pointer.
<i>dw_index</i>	Pass in an index value less than <code>dw_locentry_count</code> .
<i>dw_lle_value_out</i>	On success returns the DW_LLE value applicable, such as DW_LLE_start_end .
<i>dw_rawlowpc</i>	On success returns the first operand in the expression (if the expression has an operand).
<i>dw_rawhipc</i>	On success returns the second operand in the expression. (if the expression has a second operand).
<i>dw_debug_addr_unavailable</i>	On success returns FALSE if the data required to calculate <code>dw_lowpc_cooked</code> or <code>dw_hipc_cooked</code> was present or TRUE if some required data was missing (for example in split dwarf).
<i>dw_lowpc_cooked</i>	On success and if <code>dw_debug_addr_unavailable</code> FALSE returns the true low address.
<i>dw_hipc_cooked</i>	On success and if <code>dw_debug_addr_unavailable</code> FALSE returns the true high address.
<i>dw_locexpr_op_count_out</i>	On success returns the count of operations in the expression.
<i>dw_locentry_out</i>	On success returns a pointer to a specific location description.
<i>dw_loclist_source_out</i>	On success returns the applicable DW_LKIND value.
<i>dw_expression_offset_out</i>	On success returns the offset of the expression in the applicable section.
<i>dw_locdesc_offset_out</i>	On return sets the offset to the location description offset (if that is meaningful) or zero for simple location expressions.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc.

**9.14.2.4 dwarf\_get\_locdesc\_entry\_e()**

```
DW_API int dwarf_get_locdesc_entry_e (
    Dwarf_Loc_Head_c dw_loclist_head,
    Dwarf_Unsigned dw_index,
    Dwarf_Small * dw_lle_value_out,
    Dwarf_Unsigned * dw_rawlowpc,
    Dwarf_Unsigned * dw_rawhipc,
    Dwarf_Bool * dw_debug_addr_unavailable,
    Dwarf_Addr * dw_lowpc_cooked,
    Dwarf_Addr * dw_hipc_cooked,
    Dwarf_Unsigned * dw_locexpr_op_count_out,
    Dwarf_Unsigned * dw_lle_bytecount,
    Dwarf_Locdesc_c * dw_locentry_out,
    Dwarf_Small * dw_loclist_source_out,
    Dwarf_Unsigned * dw_expression_offset_out,
    Dwarf_Unsigned * dw_locdesc_offset_out,
    Dwarf_Error * dw_error )
```

Retrieve the details(\_e) of a location expression.

Cooked value means the addresses from the location description after base values applied, so they are actual addresses. `debug_addr_unavailable` non-zero means the record from a Split Dwarf skeleton unit could not be accessed from the .dwo section or dwp object so the cooked values could not be calculated.

This is identical to `dwarf_get_locdesc_entry_d` except that it adds a pointer argument so the caller can know the size, in bytes, of the loclist DW\_LLE operation itself.

It's used by `dwarfdump` but it is unlikely to be of interest to most callers..

**9.14.2.5 dwarf\_get\_loclist\_c()**

```
DW_API int dwarf_get_loclist_c (
    Dwarf_Attribute dw_attr,
    Dwarf_Loc_Head_c * dw_loclist_head,
    Dwarf_Unsigned * dw_locentry_count,
    Dwarf_Error * dw_error )
```

Location Lists and Expressions.

This works on DWARF2 through DWARF5.

**See also**

[Location/expression access](#)

## Parameters

<i>dw_attr</i>	The attribute must refer to a location expression or a location list, so must be DW_FORM_block, DW_FORM_exprloc, or a loclist reference form..
<i>dw_loclist_head</i>	On success returns a pointer to the created loclist head record.
<i>dw_locentry_count</i>	On success returns the count of records. For an expression it will be one.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

## 9.14.2.6 dwarf\_get\_loclist\_context\_basics()

```
DW_API int dwarf_get_loclist_context_basics (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_index,
    Dwarf_Unsigned * dw_header_offset,
    Dwarf_Small * dw_offset_size,
    Dwarf_Small * dw_extension_size,
    unsigned int * dw_version,
    Dwarf_Small * dw_address_size,
    Dwarf_Small * dw_segment_selector_size,
    Dwarf_Unsigned * dw_offset_entry_count,
    Dwarf_Unsigned * dw_offset_of_offset_array,
    Dwarf_Unsigned * dw_offset_of_first_locentry,
    Dwarf_Unsigned * dw_offset_past_last_locentry,
    Dwarf_Error * dw_error )
```

Return basic data about a loclists context.

Some of the same values as from dwarf\_get\_loclist\_head\_basics but here without any dependence on data derived from a CU context. Useful to print raw loclist data.

## 9.14.2.7 dwarf\_get\_loclist\_head\_basics()

```
DW_API int dwarf_get_loclist_head_basics (
    Dwarf_Loc_Head_c dw_head,
    Dwarf_Small * dw_lkind,
    Dwarf_Unsigned * dw_lle_count,
    Dwarf_Unsigned * dw_loclists_version,
    Dwarf_Unsigned * dw_loclists_index_returned,
    Dwarf_Unsigned * dw_bytes_total_in_rle,
    Dwarf_Half * dw_offset_size,
    Dwarf_Half * dw_address_size,
    Dwarf_Half * dw_segment_selector_size,
    Dwarf_Unsigned * dw_overall_offset_of_this_context,
    Dwarf_Unsigned * dw_total_length_of_this_context,
    Dwarf_Unsigned * dw_offset_table_offset,
    Dwarf_Unsigned * dw_offset_table_entrycount,
    Dwarf_Bool * dw_loclists_base_present,
    Dwarf_Unsigned * dw_loclists_base,
```

```

Dwarf_Bool * dw_loclists_base_address_present,
Dwarf_Unsigned * dw_loclists_base_address,
Dwarf_Bool * dw_loclists_debug_addr_base_present,
Dwarf_Unsigned * dw_loclists_debug_addr_base,
Dwarf_Unsigned * dw_offset_this_lle_area,
Dwarf_Error * dw_error )

```

Return basic data about a loclists head.

Used by dwarfdump to print basic data from the data generated to look at a specific loclist context as returned by dwarf\_loclists\_index\_get\_lle\_head() or dwarf\_loclists\_offset\_get\_lle\_head. Here we know there was a Dwarf↵\_Attribute so additional things are known as compared to calling dwarf\_get\_loclist\_context\_basics See DWARF5 Section 7.20 Location List Table page 243.

#### 9.14.2.8 dwarf\_get\_loclist\_head\_kind()

```

DW_API int dwarf_get_loclist_head_kind (
    Dwarf_Loc_Head_c dw_loclist_head,
    unsigned int * dw_lkind,
    Dwarf_Error * dw_error )

```

Know what kind of location data it is.

##### Parameters

<i>dw_loclist_head</i>	Pass in a loclist head pointer.
<i>dw_lkind</i>	On success returns the loclist kind through the pointer. For example DW_LKIND_expression.
<i>dw_error</i>	The usual error detail return pointer.

##### Returns

Returns DW\_DLV\_OK etc.

#### 9.14.2.9 dwarf\_get\_loclist\_lle()

```

DW_API int dwarf_get_loclist_lle (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_contextnumber,
    Dwarf_Unsigned dw_entry_offset,
    Dwarf_Unsigned dw_endoffset,
    unsigned int * dw_entrylen,
    unsigned int * dw_entry_kind,
    Dwarf_Unsigned * dw_entry_operand1,
    Dwarf_Unsigned * dw_entry_operand2,
    Dwarf_Unsigned * dw_expr_ops_blocksize,
    Dwarf_Unsigned * dw_expr_ops_offset,
    Dwarf_Small ** dw_expr_opsdata,
    Dwarf_Error * dw_error )

```

Return basic data about a loclists context entry.

Useful to print raw loclist data.

### 9.14.2.10 dwarf\_get\_loclist\_offset\_index\_value()

```
DW_API int dwarf_get_loclist_offset_index_value (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_context_index,
    Dwarf_Unsigned dw_offsetentry_index,
    Dwarf_Unsigned * dw_offset_value_out,
    Dwarf_Unsigned * dw_global_offset_value_out,
    Dwarf_Error * dw_error )
```

Return certain loclists offsets.

Useful with the DWARF5 .debug\_loclists section.

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_context_index</i>	Pass in the loclists context index.
<i>dw_offsetentry_index</i>	Pass in the offset array index.
<i>dw_offset_value_out</i>	On success returns the offset value at offset table[dw_offsetentry_index], an offset local to this context.
<i>dw_global_offset_value_out</i>	On success returns the same offset value but with the offset of the table added in to form a section offset.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc. If one of the indexes passed in is out of range it returns DW\_DLV\_NO\_ENTRY.

### 9.14.2.11 dwarf\_load\_loclists()

```
DW_API int dwarf_load_loclists (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned * dw_loclists_count,
    Dwarf_Error * dw_error )
```

Load Loclists.

This loads raw .debug\_loclists (DWARF5). It is unlikely you have a reason to use this function. If CUs or DIES have been referenced in any way loading is already done. A duplicate loading attempt returns DW\_DLV\_OK immediately, returning dw\_loclists\_count filled in and does nothing else.

Doing it more than once is never necessary or harmful. There is no deallocation call made visible, deallocation happens when [dwarf\\_finish\(\)](#) is called.

#### Parameters

<i>dw_dbg</i>	The applicable Dwarf_Debug.
<i>dw_loclists_count</i>	On success, returns the number of DWARF5 loclists contexts in the section, whether this is the first or a duplicate load.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK if it loaded successfully or if it is a duplicate load. If no .debug\_loclists present returns DW\_DLV\_NO\_ENTRY.

**9.14.2.12 dwarf\_loclist\_from\_expr\_c()**

```
DW_API int dwarf_loclist_from_expr_c (
    Dwarf_Debug dw_dbg,
    Dwarf_Ptr dw_expression_in,
    Dwarf_Unsigned dw_expression_length,
    Dwarf_Half dw_address_size,
    Dwarf_Half dw_offset_size,
    Dwarf_Half dw_dwarf_version,
    Dwarf_Loc_Head_c * dw_loc_head,
    Dwarf_Unsigned * dw_listlen,
    Dwarf_Error * dw_error )
```

Generate a Dwarf\_Loc\_Head\_c from an expression block.

Useful if you have an expression block (from somewhere), do not have a Dwarf\_Attribute available, and wish to deal with the expression.

**See also**

[Reading a location expression](#)

**Parameters**

<i>dw_dbg</i>	The applicable Dwarf_Debug
<i>dw_expression_in</i>	Pass in a pointer to the expression bytes.
<i>dw_expression_length</i>	Pass in the length, in bytes, of the expression.
<i>dw_address_size</i>	Pass in the applicable address_size.
<i>dw_offset_size</i>	Pass in the applicable offset size.
<i>dw_dwarf_version</i>	Pass in the applicable dwarf version.
<i>dw_loc_head</i>	On success returns a pointer to a dwarf location head record for use in getting to the details of the expression.
<i>dw_listlen</i>	On success, sets the listlen to one.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc.

**9.15 .debug\_addr access: DWARF5****Functions**

- DW\_API int [dwarf\\_debug\\_addr\\_table](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Unsigned dw\_section\_offset, Dwarf\_Debug\_Addr\_Table \*dw\_table\_header, Dwarf\_Unsigned \*dw\_length, Dwarf\_Half \*dw\_version, Dwarf\_Small \*dw\_address\_size, Dwarf\_Unsigned \*dw\_at\_addr\_base, Dwarf\_Unsigned \*dw\_entry\_count, Dwarf\_Unsigned \*dw\_next\_table\_offset, Dwarf\_Error \*dw\_error)

*Return a .debug\_addr table.*

- DW\_API int `dwarf_debug_addr_by_index` (`Dwarf_Debug_Addr_Table` dw\_dat, `Dwarf_Unsigned` dw\_entry\_index, `Dwarf_Unsigned` \*dw\_address, `Dwarf_Error` \*dw\_error)

*Return .debug\_addr address given table index.*

- DW\_API void `dwarf_dealloc_debug_addr_table` (`Dwarf_Debug_Addr_Table` dw\_dat)  
*dealloc (free) a Dwarf\_Attr\_Table record.*

### 9.15.1 Detailed Description

Reading just the .debug\_addr section.

These functions solely useful for reading that section. It seems unlikely you would have a reason to call these. The functions getting attribute values use the section when appropriate without using these functions.

### 9.15.2 Function Documentation

#### 9.15.2.1 dwarf\_dealloc\_debug\_addr\_table()

```
DW_API void dwarf_dealloc_debug_addr_table (
    Dwarf_Debug_Addr_Table dw_dat )
```

dealloc (free) a Dwarf\_Attr\_Table record.

##### Parameters

<i>dw_dat</i>	Pass in a valid Dwarf_Debug_Addr_Table pointer. Does nothing if the dw_dat field is NULL.
---------------	---

#### 9.15.2.2 dwarf\_debug\_addr\_by\_index()

```
DW_API int dwarf_debug_addr_by_index (
    Dwarf_Debug_Addr_Table dw_dat,
    Dwarf_Unsigned dw_entry_index,
    Dwarf_Unsigned * dw_address,
    Dwarf_Error * dw_error )
```

Return .debug\_addr address given table index.

##### Parameters

<i>dw_dat</i>	Pass in a Dwarf_Debug_Addr_Table pointer.
<i>dw_entry_index</i>	Pass in a Dwarf_Debug_Addr_Table index to an address. If out of the valid range 0 through dw_entry_count-1 the function returns DW_DLV_NO_ENTRY.
<i>dw_address</i>	Returns an address in the program through the pointer.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc. If the dw\_section\_offset passed in is out of range it returns DW\_DLV\_NO\_ENTRY. If it returns DW\_DLV\_ERROR only dw\_error is set, dw\_address is not set.

**9.15.2.3 dwarf\_debug\_addr\_table()**

```
DW_API int dwarf_debug_addr_table (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_section_offset,
    Dwarf_Debug_Addr_Table * dw_table_header,
    Dwarf_Unsigned * dw_length,
    Dwarf_Half * dw_version,
    Dwarf_Small * dw_address_size,
    Dwarf_Unsigned * dw_at_addr_base,
    Dwarf_Unsigned * dw_entry_count,
    Dwarf_Unsigned * dw_next_table_offset,
    Dwarf_Error * dw_error )
```

Return a .debug\_addr table.

Allocates and returns a pointer to a Dwarf\_Debug\_Addr\_Table as well as the contents of the record.

Other than dw\_debug and dw\_error and dw\_table\_header a NULL passed in as a pointer argument means the return value will not be set through the pointer, so a caller can pass NULL for return values of no immediate interest.

It is only intended to enable printing of the simple DWARF5 .debug\_addr section (by dwarfdump).

When emitting DWARF4, gcc may emit a GNU-specified .debug\_addr format. If some CU has been opened then this call will work, but the single table will have all the entries for all CUs.

**Parameters**

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_section_offset</i>	Pass in the section offset of a table header. Start with zero. If the passed-in offset is past the last byte of the table the function returns DW_DLV_NO_ENTRY.
<i>dw_table_header</i>	On success Returns a pointer to a Dwarf_Debug_Addr_Table for use with dwarf_get_attr_by_index().
<i>dw_length</i>	On success Returns the length in bytes of this contribution to .debug_addr from the table header, including the table length field and the array of addresses.
<i>dw_version</i>	On success returns the version number, which should be 5.
<i>dw_address_size</i>	On success returns the address size of the address entries in this table.
<i>dw_at_addr_base</i>	On success returns the value that will appear in some DW_AT_addr_base attribute.
<i>dw_entry_count</i>	On success returns the number of table entries in this table instance.
<i>dw_next_table_offset</i>	On success returns the offset of the next table in the section. Use the offset returned in the next call to this function.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc. If the dw\_section\_offset passed in is out of range it returns DW\_DLV\_NO\_ENTRY. If it returns DW\_DLV\_ERROR only dw\_error is set, none of the other return values are set through the pointers.

## 9.16 Macro Access: DWARF5

### Functions

- DW\_API int [dwarf\\_get\\_macro\\_context](#) (Dwarf\_Die dw\_die, Dwarf\_Unsigned \*dw\_version\_out, Dwarf\_Macro\_Context \*dw\_macro\_context, Dwarf\_Unsigned \*dw\_macro\_unit\_offset\_out, Dwarf\_Unsigned \*dw\_macro\_ops\_count\_out, Dwarf\_Unsigned \*dw\_macro\_ops\_data\_length\_out, Dwarf\_Error \*dw\_error)  
*DWARF5 .debug\_macro access via Dwarf\_Die.*
- DW\_API int [dwarf\\_get\\_macro\\_context\\_by\\_offset](#) (Dwarf\_Die dw\_die, Dwarf\_Unsigned dw\_offset, Dwarf\_Unsigned \*dw\_version\_out, Dwarf\_Macro\_Context \*dw\_macro\_context, Dwarf\_Unsigned \*dw\_macro\_ops\_count\_out, Dwarf\_Unsigned \*dw\_macro\_ops\_data\_length, Dwarf\_Error \*dw\_error)  
*DWARF5 .debug\_macro access via Dwarf\_Die and an offset.*
- DW\_API int [dwarf\\_macro\\_context\\_total\\_length](#) (Dwarf\_Macro\_Context dw\_context, Dwarf\_Unsigned \*dw\_mac\_total\_len, Dwarf\_Error \*dw\_error)  
*Return a macro context total length.*
- DW\_API void [dwarf\\_dealloc\\_macro\\_context](#) (Dwarf\_Macro\_Context dw\_mc)  
*Dealloc a macro context.*
- DW\_API int [dwarf\\_macro\\_context\\_head](#) (Dwarf\_Macro\_Context dw\_mc, Dwarf\_Half \*dw\_version, Dwarf\_Unsigned \*dw\_mac\_offset, Dwarf\_Unsigned \*dw\_mac\_len, Dwarf\_Unsigned \*dw\_mac\_header\_len, unsigned int \*dw\_flags, Dwarf\_Bool \*dw\_has\_line\_offset, Dwarf\_Unsigned \*dw\_line\_offset, Dwarf\_Bool \*dw\_has\_offset\_size\_64, Dwarf\_Bool \*dw\_has\_operands\_table, Dwarf\_Half \*dw\_opcode\_count, Dwarf\_Error \*dw\_error)

*Access to the details of the opcode operands table.*
- DW\_API int [dwarf\\_get\\_macro\\_op](#) (Dwarf\_Macro\_Context dw\_macro\_context, Dwarf\_Unsigned dw\_op\_number, Dwarf\_Unsigned \*dw\_op\_start\_section\_offset, Dwarf\_Half \*dw\_macro\_operator, Dwarf\_Half \*dw\_forms\_count, const Dwarf\_Small \*\*dw\_formcode\_array, Dwarf\_Error \*dw\_error)  
*Access macro operation details of a single operation.*
- DW\_API int [dwarf\\_get\\_macro\\_defundef](#) (Dwarf\_Macro\_Context dw\_macro\_context, Dwarf\_Unsigned dw\_op\_number, Dwarf\_Unsigned \*dw\_line\_number, Dwarf\_Unsigned \*dw\_index, Dwarf\_Unsigned \*dw\_offset, Dwarf\_Half \*dw\_forms\_count, const char \*\*dw\_macro\_string, Dwarf\_Error \*dw\_error)  
*Get Macro defundef.*
- DW\_API int [dwarf\\_get\\_macro\\_startend\\_file](#) (Dwarf\_Macro\_Context dw\_macro\_context, Dwarf\_Unsigned dw\_op\_number, Dwarf\_Unsigned \*dw\_line\_number, Dwarf\_Unsigned \*dw\_name\_index\_to\_line\_tab, const char \*\*dw\_src\_file\_name, Dwarf\_Error \*dw\_error)  
*Get Macro start end.*
- DW\_API int [dwarf\\_get\\_macro\\_import](#) (Dwarf\_Macro\_Context dw\_macro\_context, Dwarf\_Unsigned dw\_op\_number, Dwarf\_Unsigned \*dw\_target\_offset, Dwarf\_Error \*dw\_error)  
*Get Macro import.*

### 9.16.1 Detailed Description

Reading the .debug\_macro section.

See also

[Reading .debug\\_macro data \(DWARF5\)](#) An example reading .debug\_macro

## 9.16.2 Function Documentation

### 9.16.2.1 dwarf\_dealloc\_macro\_context()

```
DW_API void dwarf_dealloc_macro_context (
    Dwarf_Macro_Context dw_mc )
```

Dealloc a macro context.

#### Parameters

<i>dw_mc</i>	A pointer to the macro context of interest. On return the caller should zero the pointer as the pointer is then stale.
--------------	--

### 9.16.2.2 dwarf\_get\_macro\_context()

```
DW_API int dwarf_get_macro_context (
    Dwarf_Die dw_die,
    Dwarf_Unsigned * dw_version_out,
    Dwarf_Macro_Context * dw_macro_context,
    Dwarf_Unsigned * dw_macro_unit_offset_out,
    Dwarf_Unsigned * dw_macro_ops_count_out,
    Dwarf_Unsigned * dw_macro_ops_data_length_out,
    Dwarf_Error * dw_error )
```

DWARF5 .debug\_macro access via Dwarf\_Die.

#### See also

[Reading .debug\\_macro data \(DWARF5\)](#)

#### Parameters

<i>dw_die</i>	The CU DIE of interest.
<i>dw_version_out</i>	On success returns the macro context version (5)
<i>dw_macro_context</i>	On success returns a pointer to a macro context which allows access to the context content.
<i>dw_macro_unit_offset_out</i>	On success returns the offset of the macro context.
<i>dw_macro_ops_count_out</i>	On success returns the number of macro operations in the context.
<i>dw_macro_ops_data_length_out</i>	On success returns the length in bytes of the operations in the context.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc. If no .debug\_macro section exists for the CU it returns DW\_DLV\_NO\_ENTRY.

### 9.16.2.3 dwarf\_get\_macro\_context\_by\_offset()

```
DW_API int dwarf_get_macro_context_by_offset (
    Dwarf_Die dw_die,
```

```

Dwarf_Unsigned dw_offset,
Dwarf_Unsigned * dw_version_out,
Dwarf_Macro_Context * dw_macro_context,
Dwarf_Unsigned * dw_macro_ops_count_out,
Dwarf_Unsigned * dw_macro_ops_data_length,
Dwarf_Error * dw_error )

```

DWARF5 .debug\_macro access via Dwarf\_Die and an offset.

#### Parameters

<i>dw_die</i>	The CU DIE of interest.
<i>dw_offset</i>	The offset in the section to begin reading.
<i>dw_version_out</i>	On success returns the macro context version (5)
<i>dw_macro_context</i>	On success returns a pointer to a macro context which allows access to the context content.
<i>dw_macro_ops_count_out</i>	On success returns the number of macro operations in the context.
<i>dw_macro_ops_data_length</i>	On success returns the length in bytes of the macro context, starting at the offset of the first byte of the context.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc. If no .debug\_macro section exists for the CU it returns DW\_DLV\_NO\_ENTRY. If the dw\_offset is outside the section it returns DW\_DLV\_ERROR.

#### 9.16.2.4 dwarf\_get\_macro\_defundef()

```

DW_API int dwarf_get_macro_defundef (
    Dwarf_Macro_Context dw_macro_context,
    Dwarf_Unsigned dw_op_number,
    Dwarf_Unsigned * dw_line_number,
    Dwarf_Unsigned * dw_index,
    Dwarf_Unsigned * dw_offset,
    Dwarf_Half * dw_forms_count,
    const char ** dw_macro_string,
    Dwarf_Error * dw_error )

```

Get Macro defundef.

To extract the value portion of a macro define:

#### See also

[dwarf\\_find\\_macro\\_value\\_start](#)

#### Parameters

<i>dw_macro_context</i>	The macro context of interest.
<i>dw_op_number</i>	valid values are 0 through dw_macro_ops_count_out-1. The op number must be for a def/undef.
<i>dw_line_number</i>	The line number in the user source for this define/undef

## Parameters

<i>dw_index</i>	On success if the macro is an strx form the value returned is the string index in the record, otherwise zero is returned.
<i>dw_offset</i>	On success if the macro is an strp or sup form the value returned is the string offset in the appropriate section, otherwise zero is returned.
<i>dw_forms_count</i>	On success the value 2 is returned.
<i>dw_macro_string</i>	On success a pointer to a null-terminated string is returned. Do not dealloc or free this string.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc. It is an error if operator *dw\_op\_number* is not a DW\_MACRO\_define, DW\_MACRO\_undef, DW\_MACRO\_define\_strp, DW\_MACRO\_undef\_strp, DW\_MACRO\_undef\_sup, DW\_MACRO\_undef\_sup, DW\_MACRO\_define\_strx, or DW\_MACRO\_undef\_strx,

## 9.16.2.5 dwarf\_get\_macro\_import()

```
DW_API int dwarf_get_macro_import (
    Dwarf_Macro_Context dw_macro_context,
    Dwarf_Unsigned dw_op_number,
    Dwarf_Unsigned * dw_target_offset,
    Dwarf_Error * dw_error )
```

Get Macro import.

## Parameters

<i>dw_macro_context</i>	The macro context of interest.
<i>dw_op_number</i>	Valid values are 0 through <i>dw_macro_ops_count_out</i> -1.
<i>dw_target_offset</i>	Returns the offset in the imported section.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc. It is an error if the operator is not DW\_MACRO\_import or DW\_MACRO\_import\_sup.

## 9.16.2.6 dwarf\_get\_macro\_op()

```
DW_API int dwarf_get_macro_op (
    Dwarf_Macro_Context dw_macro_context,
    Dwarf_Unsigned dw_op_number,
    Dwarf_Unsigned * dw_op_start_section_offset,
    Dwarf_Half * dw_macro_operator,
    Dwarf_Half * dw_forms_count,
    const Dwarf_Small ** dw_formcode_array,
    Dwarf_Error * dw_error )
```

Access macro operation details of a single operation.

Useful for printing basic data about the operation.

## Parameters

<i>dw_macro_context</i>	The macro context of interest.
<i>dw_op_number</i>	valid values are 0 through <i>dw_macro_ops_count_out</i> -1.
<i>dw_op_start_section_offset</i>	On success returns the section offset of this operator.
<i>dw_macro_operator</i>	On success returns the the macro operator itself, for example DW_MACRO_define.
<i>dw_forms_count</i>	On success returns the number of forms in the formcode array.
<i>dw_formcode_array</i>	On success returns a pointer to the formcode array of operand forms.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

## 9.16.2.7 dwarf\_get\_macro\_startend\_file()

```
DW_API int dwarf_get_macro_startend_file (
    Dwarf_Macro_Context dw_macro_context,
    Dwarf_Unsigned dw_op_number,
    Dwarf_Unsigned * dw_line_number,
    Dwarf_Unsigned * dw_name_index_to_line_tab,
    const char ** dw_src_file_name,
    Dwarf_Error * dw_error )
```

Get Macro start end.

## Parameters

<i>dw_macro_context</i>	The macro context of interest.
<i>dw_op_number</i>	Valid values are 0 through <i>dw_macro_ops_count_out</i> -1. The op number must be for a start/end.
<i>dw_line_number</i>	If end_file nothing is returned here. If start_file on success returns the line number of the source line of the include directive.
<i>dw_name_index_to_line_tab</i>	If end_file nothing is returned here. If start_file on success returns the file name index in the line table file names table.
<i>dw_src_file_name</i>	If end_file nothing is returned here. If start_file on success returns a pointer to the null-terminated source file name. Do not free or dealloc this string.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc. It is an error if the operator is not DW\_MACRO\_start\_file or DW\_MACRO\_end\_file.

## 9.16.2.8 dwarf\_macro\_context\_head()

```
DW_API int dwarf_macro_context_head (
    Dwarf_Macro_Context dw_mc,
    Dwarf_Half * dw_version,
    Dwarf_Unsigned * dw_mac_offset,
```

```

Dwarf_Unsigned * dw_mac_len,
Dwarf_Unsigned * dw_mac_header_len,
unsigned int * dw_flags,
Dwarf_Bool * dw_has_line_offset,
Dwarf_Unsigned * dw_line_offset,
Dwarf_Bool * dw_has_offset_size_64,
Dwarf_Bool * dw_has_operands_table,
Dwarf_Half * dw_opcode_count,
Dwarf_Error * dw_error )

```

Access the internal details of a Dwarf\_Macro\_Context.

Not described in detail here. See DWARF5 Standard Section 6.3.1 Macro Information Header page 166.

#### 9.16.2.9 dwarf\_macro\_context\_total\_length()

```

DW_API int dwarf_macro_context_total_length (
    Dwarf_Macro_Context dw_context,
    Dwarf_Unsigned * dw_mac_total_len,
    Dwarf_Error * dw_error )

```

Return a macro context total length.

##### Parameters

<i>dw_context</i>	A pointer to the macro context of interest.
<i>dw_mac_total_len</i>	On success returns the length in bytes of the macro context.
<i>dw_error</i>	The usual error detail return pointer.

##### Returns

Returns DW\_DLV\_OK etc.

#### 9.16.2.10 dwarf\_macro\_operands\_table()

```

DW_API int dwarf_macro_operands_table (
    Dwarf_Macro_Context dw_mc,
    Dwarf_Half dw_index,
    Dwarf_Half * dw_opcode_number,
    Dwarf_Half * dw_operand_count,
    const Dwarf_Small ** dw_operand_array,
    Dwarf_Error * dw_error )

```

Access to the details of the opcode operands table.

Not of much interest to most libdwarf users.

##### Parameters

<i>dw_mc</i>	The macro context of interest.
<i>dw_index</i>	The opcode operands table index. 0 through dw_opcode_count-1.
<i>dw_opcode_number</i>	On success returns the opcode number in the table.
<i>dw_operand_count</i>	On success returns the number of forms for that dw_index.
<i>dw_operand_array</i>	On success returns the array of op operand forms
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc.

## 9.17 Macro Access: DWARF2-4

**Functions**

- DW\_API char \* [dwarf\\_find\\_macro\\_value\\_start](#) (char \*dw\_macro\_string)  
*Return a pointer to the value part of a macro.*
- DW\_API int [dwarf\\_get\\_macro\\_details](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Off](#) dw\_macro\_offset, [Dwarf\\_Unsigned](#) dw\_maximum\_count, [Dwarf\\_Signed](#) \*dw\_entry\_count, [Dwarf\\_Macro\\_Details](#) \*\*dw\_details, [Dwarf\\_Error](#) \*dw\_error)  
*Getting .debug\_macinfo macro details.*

### 9.17.1 Detailed Description

Reading the .debug\_macinfo section.

The section is rarely used since it takes a lot of disk space. DWARF5 has much more compact macro data (in section .debug\_macro).

For an example see

See also

[Reading .debug\\_macinfo \(DWARF2-4\)](#) An example reading .debug\_macinfo

### 9.17.2 Function Documentation

#### 9.17.2.1 dwarf\_find\_macro\_value\_start()

```
DW_API char * dwarf_find_macro_value_start (
    char * dw_macro_string )
```

Return a pointer to the value part of a macro.

This function Works for all versions, DWARF2-DWARF5

**Parameters**

<i>dw_macro_string</i>	The macro string passed in should be properly formatted with a name, a space, and then the value portion (whether a function-like macro or not function-like).
------------------------	--

**Returns**

On success it returns a pointer to the value portion of the macro. On failure it returns a pointer to a NUL byte (so a zero-length string).

### 9.17.2.2 dwarf\_get\_macro\_details()

```
DW_API int dwarf_get_macro_details (
    Dwarf_Debug dw_dbg,
    Dwarf_Off dw_macro_offset,
    Dwarf_Unsigned dw_maximum_count,
    Dwarf_Signed * dw_entry_count,
    Dwarf_Macro_Details ** dw_details,
    Dwarf_Error * dw_error )
```

Getting .debug\_machinfo macro details.

[An example calling this function](#)

See also

[Reading .debug\\_machinfo \(DWARF2-4\)](#)

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_macro_offset</i>	The offset in the section you wish to start from.
<i>dw_maximum_count</i>	Pass in a count to ensure we will not allocate an excessive amount (guarding against a
<i>dw_entry_count</i>	On success returns a count of the macro operations in a CU macro set.
<i>dw_details</i>	On success returns a pointer to an array of struct DW_Macro_Details_s .
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

## 9.18 Stack Frame Access

### Typedefs

- typedef int(\* [dwarf\\_iterate\\_fde\\_callback\\_function\\_type](#)) ([Dwarf\\_Regtable3](#) \*dw\_reg\_table, [Dwarf\\_Addr](#) dw↵\_row\_pc, [Dwarf\\_Bool](#) dw\_has\_more\_rows, [Dwarf\\_Addr](#) dw\_subsequent\_pc, void \*dw\_user\_data)

### Functions

- DW\_API int [dwarf\\_get\\_fde\\_list](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Cie](#) \*\*dw\_cie\_data, [Dwarf\\_Signed](#) \*dw\_cie↵\_element\_count, [Dwarf\\_Fde](#) \*\*dw\_fde\_data, [Dwarf\\_Signed](#) \*dw\_fde\_element\_count, [Dwarf\\_Error](#) \*dw↵\_error)
 

*Get lists of .debug\_frame FDEs and CIEs.*
- DW\_API int [dwarf\\_get\\_fde\\_list\\_eh](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Cie](#) \*\*dw\_cie\_data, [Dwarf\\_Signed](#) \*dw↵\_cie\_element\_count, [Dwarf\\_Fde](#) \*\*dw\_fde\_data, [Dwarf\\_Signed](#) \*dw\_fde\_element\_count, [Dwarf\\_Error](#) \*dw\_error)
 

*Get lists of .eh\_frame FDEs and CIEs.*
- DW\_API void [dwarf\\_dealloc\\_fde\\_cie\\_list](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Cie](#) \*dw\_cie\_data, [Dwarf\\_Signed](#) dw\_cie\_element\_count, [Dwarf\\_Fde](#) \*dw\_fde\_data, [Dwarf\\_Signed](#) dw\_fde\_element\_count)

*Release storage associated with FDE and CIE arrays.*

- DW\_API int `dwarf_get_fde_range` (Dwarf\_Fde dw\_fde, Dwarf\_Addr \*dw\_low\_pc, Dwarf\_Unsigned \*dw\_func\_length, Dwarf\_Small \*\*dw\_fde\_bytes, Dwarf\_Unsigned \*dw\_fde\_byte\_length, Dwarf\_Off \*dw\_cie\_offset, Dwarf\_Signed \*dw\_cie\_index, Dwarf\_Off \*dw\_fde\_offset, Dwarf\_Error \*dw\_error)

*Return the FDE data for a single FDE.*

- DW\_API int `dwarf_get_fde_exception_info` (Dwarf\_Fde dw\_fde, Dwarf\_Signed \*dw\_offset\_into\_exception\_tables, Dwarf\_Error \*dw\_error)

*IRIX only access to C++ destructor tables.*

- DW\_API int `dwarf_get_cie_of_fde` (Dwarf\_Fde dw\_fde, Dwarf\_Cie \*dw\_cie\_returned, Dwarf\_Error \*dw\_error)

*Given FDE get CIE.*

- DW\_API int `dwarf_get_cie_info_b` (Dwarf\_Cie dw\_cie, Dwarf\_Unsigned \*dw\_bytes\_in\_cie, Dwarf\_Small \*dw\_version, char \*\*dw\_augmenter, Dwarf\_Unsigned \*dw\_code\_alignment\_factor, Dwarf\_Signed \*dw\_data\_alignment\_factor, Dwarf\_Half \*dw\_return\_address\_register\_rule, Dwarf\_Small \*\*dw\_initial\_instructions, Dwarf\_Unsigned \*dw\_initial\_instructions\_length, Dwarf\_Half \*dw\_offset\_size, Dwarf\_Error \*dw\_error)

*Given a CIE get access to its content.*

- DW\_API int `dwarf_get_cie_index` (Dwarf\_Cie dw\_cie, Dwarf\_Signed \*dw\_index, Dwarf\_Error \*dw\_error)

*Return CIE index given CIE.*

- DW\_API int `dwarf_get_fde_instr_bytes` (Dwarf\_Fde dw\_fde, Dwarf\_Small \*\*dw\_outinstrs, Dwarf\_Unsigned \*dw\_outlen, Dwarf\_Error \*dw\_error)

*Return length and pointer to access frame instructions.*

- DW\_API int `dwarf_iterate_fde_all_regs3` (Dwarf\_Fde dw\_fde, Dwarf\_Regtable3 \*dw\_reg\_table, dwarf\_iterate\_fde\_callback\_func dw\_callback, void \*dw\_callback\_user\_data, Dwarf\_Error \*dw\_error)

*Iterate all rows for a given FDE. Invokes a provided callback function for each row. Iteration continues until all rows have been visited.*

- DW\_API int `dwarf_get_fde_info_for_all_regs3_b` (Dwarf\_Fde dw\_fde, Dwarf\_Addr dw\_pc\_requested, Dwarf\_Regtable3 \*dw\_reg\_table, Dwarf\_Addr \*dw\_row\_pc, Dwarf\_Bool \*dw\_has\_more\_rows, Dwarf\_Addr \*dw\_subsequent\_pc, Dwarf\_Error \*dw\_error)

*Return information on frame registers at a given pc value.*

- DW\_API int `dwarf_get_fde_info_for_all_regs3` (Dwarf\_Fde dw\_fde, Dwarf\_Addr dw\_pc\_requested, Dwarf\_Regtable3 \*dw\_reg\_table, Dwarf\_Addr \*dw\_row\_pc, Dwarf\_Error \*dw\_error)

*Return information on frame registers at a given pc value.*

- DW\_API int `dwarf_get_fde_info_for_reg3_c` (Dwarf\_Fde dw\_fde, Dwarf\_Half dw\_table\_column, Dwarf\_Addr dw\_pc\_requested, Dwarf\_Small \*dw\_value\_type, Dwarf\_Unsigned \*dw\_offset\_relevant, Dwarf\_Unsigned \*dw\_register, Dwarf\_Signed \*dw\_offset, Dwarf\_Block \*dw\_block\_content, Dwarf\_Addr \*dw\_row\_pc\_out, Dwarf\_Bool \*dw\_has\_more\_rows, Dwarf\_Addr \*dw\_subsequent\_pc, Dwarf\_Error \*dw\_error)

*Return details about a particular pc and register.*

- DW\_API int `dwarf_get_fde_info_for_reg3_b` (Dwarf\_Fde dw\_fde, Dwarf\_Half dw\_table\_column, Dwarf\_Addr dw\_pc\_requested, Dwarf\_Small \*dw\_value\_type, Dwarf\_Unsigned \*dw\_offset\_relevant, Dwarf\_Unsigned \*dw\_register, Dwarf\_Unsigned \*dw\_offset, Dwarf\_Block \*dw\_block\_content, Dwarf\_Addr \*dw\_row\_pc\_out, Dwarf\_Bool \*dw\_has\_more\_rows, Dwarf\_Addr \*dw\_subsequent\_pc, Dwarf\_Error \*dw\_error)

*Return details about a particular pc and register.*

- DW\_API int `dwarf_get_fde_info_for_cfa_reg3_c` (Dwarf\_Fde dw\_fde, Dwarf\_Addr dw\_pc\_requested, Dwarf\_Small \*dw\_value\_type, Dwarf\_Unsigned \*dw\_offset\_relevant, Dwarf\_Unsigned \*dw\_register, Dwarf\_Signed \*dw\_offset, Dwarf\_Block \*dw\_block, Dwarf\_Addr \*dw\_row\_pc\_out, Dwarf\_Bool \*dw\_has\_more\_rows, Dwarf\_Addr \*dw\_subsequent\_pc, Dwarf\_Error \*dw\_error)

*Get the value of the CFA for a particular pc value.*

- DW\_API int `dwarf_get_fde_info_for_cfa_reg3_b` (Dwarf\_Fde dw\_fde, Dwarf\_Addr dw\_pc\_requested, Dwarf\_Small \*dw\_value\_type, Dwarf\_Unsigned \*dw\_offset\_relevant, Dwarf\_Unsigned \*dw\_register, Dwarf\_Unsigned \*dw\_offset, Dwarf\_Block \*dw\_block, Dwarf\_Addr \*dw\_row\_pc\_out, Dwarf\_Bool \*dw\_has\_more\_rows, Dwarf\_Addr \*dw\_subsequent\_pc, Dwarf\_Error \*dw\_error)

*Get the value of the CFA for a particular pc value.*

- DW\_API int `dwarf_get_fde_for_die` (Dwarf\_Debug dw\_dbg, Dwarf\_Die dw\_subr\_die, Dwarf\_Fde \*dw\_returned\_fde, Dwarf\_Error \*dw\_error)

Get the fde given DW\_AT\_MIPS\_fde in a DIE.

- DW\_API int [dwarf\\_get\\_fde\\_n](#) (Dwarf\_Fde \*dw\_fde\_data, Dwarf\_Unsigned dw\_fde\_index, Dwarf\_Fde \*dw\_↵\_returned\_fde, Dwarf\_Error \*dw\_error)

Retrieve an FDE from an FDE table.

- DW\_API int [dwarf\\_get\\_fde\\_at\\_pc](#) (Dwarf\_Fde \*dw\_fde\_data, Dwarf\_Addr dw\_pc\_of\_interest, Dwarf\_Fde \*dw\_↵\_returned\_fde, Dwarf\_Addr \*dw\_lopc, Dwarf\_Addr \*dw\_hipc, Dwarf\_Error \*dw\_error)

Retrieve an FDE given a pc.

- DW\_API int [dwarf\\_get\\_cie\\_augmentation\\_data](#) (Dwarf\_Cie dw\_cie, Dwarf\_Small \*\*dw\_augdata, Dwarf\_Unsigned \*dw\_augdata\_len, Dwarf\_Error \*dw\_error)

Return .eh\_frame CIE augmentation data.

- DW\_API int [dwarf\\_get\\_fde\\_augmentation\\_data](#) (Dwarf\_Fde dw\_fde, Dwarf\_Small \*\*dw\_augdata, Dwarf\_Unsigned \*dw\_augdata\_len, Dwarf\_Error \*dw\_error)

Return .eh\_frame FDE augmentation data.

- DW\_API int [dwarf\\_expand\\_frame\\_instructions](#) (Dwarf\_Cie dw\_cie, Dwarf\_Small \*dw\_instructionspointer, Dwarf\_Unsigned dw\_length\_in\_bytes, Dwarf\_Frame\_Instr\_Head \*dw\_head, Dwarf\_Unsigned \*dw\_instr\_↵count, Dwarf\_Error \*dw\_error)

Expands CIE or FDE instructions for detailed examination. Called for CIE initial instructions and FDE instructions. Call [dwarf\\_get\\_fde\\_instr\\_bytes\(\)](#) or [dwarf\\_get\\_cie\\_info\\_b\(\)](#) to get the initial instruction bytes and instructions byte count you wish to expand.

- DW\_API int [dwarf\\_get\\_frame\\_instruction](#) (Dwarf\_Frame\_Instr\_Head dw\_head, Dwarf\_Unsigned dw\_↵instr\_index, Dwarf\_Unsigned \*dw\_instr\_offset\_in\_instrs, Dwarf\_Small \*dw\_cfa\_operation, const char \*\*dw\_fields\_description, Dwarf\_Unsigned \*dw\_u0, Dwarf\_Unsigned \*dw\_u1, Dwarf\_Signed \*dw\_s0, Dwarf\_Signed \*dw\_s1, Dwarf\_Unsigned \*dw\_code\_alignment\_factor, Dwarf\_Signed \*dw\_data\_alignment\_↵\_factor, Dwarf\_Block \*dw\_expression\_block, Dwarf\_Error \*dw\_error)

Return information about a single instruction Fields\_description means a sequence of up to three letters including u,s,r,c,d,b, terminated by NUL byte. It is a string but we test individual bytes instead of using string compares. Do not free any of the returned values.

- DW\_API int [dwarf\\_get\\_frame\\_instruction\\_a](#) (Dwarf\_Frame\_Instr\_Head dw\_, Dwarf\_Unsigned dw\_↵instr\_index, Dwarf\_Unsigned \*dw\_instr\_offset\_in\_instrs, Dwarf\_Small \*dw\_cfa\_operation, const char \*\*dw\_fields\_description, Dwarf\_Unsigned \*dw\_u0, Dwarf\_Unsigned \*dw\_u1, Dwarf\_Unsigned \*dw\_u2, Dwarf\_Signed \*dw\_s0, Dwarf\_Signed \*dw\_s1, Dwarf\_Unsigned \*dw\_code\_alignment\_factor, Dwarf\_Signed \*dw\_data\_alignment\_factor, Dwarf\_Block \*dw\_expression\_block, Dwarf\_Error \*dw\_error)

Expands CIE or FDE instructions for detailed examination. Called for CIE initial instructions and FDE instructions. This is the same as [dwarf\\_get\\_frame\\_instruction\(\)](#) except that it adds a dw\_u2 field which contains an address-space identifier if the letter a appears in dw\_fields\_description. The dw\_u2 field is non-standard and only applies to Heterogeneous Debugging frame instructions defined by LLVM (DW\_CFA\_LLVM\_def\_aspace\_cfa and DW\_CFA\_↵LLVM\_def\_aspace\_cfa\_sf)

- DW\_API void [dwarf\\_dealloc\\_frame\\_instr\\_head](#) (Dwarf\_Frame\_Instr\_Head dw\_head)

Deallocates the frame instruction data in dw\_head.

- DW\_API int [dwarf\\_fde\\_section\\_offset](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Fde dw\_in\_fde, Dwarf\_Off \*dw\_fde\_off, Dwarf\_Off \*dw\_cie\_off, Dwarf\_Error \*dw\_error)

Return FDE and CIE offsets from debugging info.

- DW\_API int [dwarf\\_cie\\_section\\_offset](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Cie dw\_in\_cie, Dwarf\_Off \*dw\_cie\_off, Dwarf\_Error \*dw\_error)

Use to print CIE offsets from debugging info.

- DW\_API Dwarf\_Half [dwarf\\_set\\_frame\\_rule\\_table\\_size](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Half dw\_value)

Frame Rule Table Size *Invariants for setting frame registers* .

- DW\_API Dwarf\_Half [dwarf\\_set\\_frame\\_rule\\_initial\\_value](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Half dw\_value)

Frame Rule Initial Value.

- DW\_API Dwarf\_Half [dwarf\\_set\\_frame\\_cfa\\_value](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Half dw\_value)

Frame CFA Column *Invariants for setting frame registers* .

- DW\_API Dwarf\_Half [dwarf\\_set\\_frame\\_same\\_value](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Half dw\_value)

Frame Same Value Default *Invariants for setting frame registers* .

- DW\_API Dwarf\_Half [dwarf\\_set\\_frame\\_undefined\\_value](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Half dw\_value)

Frame Undefined Value Default *Invariants for setting frame registers* .

### 9.18.1 Detailed Description

Use to access DWARF2-5 `.debug_frame` and GNU `.eh_frame` sections. Does not evaluate frame instructions, but provides detailed data so it is possible do that yourself.

### 9.18.2 Typedef Documentation

#### 9.18.2.1 `dwarf_iterate_fde_callback_function_type`

`dwarf_iterate_fde_callback_function_type`

Used as a function pointer to a user-written callback function. This provides the register table for a row address. See [dwarf\\_iterate\\_fde\\_all\\_regs3\(\)](#).

##### Parameters

<i>dw_reg_table</i>	The register table for address data.
<i>dw_row_pc</i>	The address for the row the callback is reporting.
<i>dw_has_more_rows</i>	If non-zero means there are more rows in the current FDE.
<i>dw_subsequent_pc</i>	The pc address of the next row in the current FDE.
<i>dw_user_data</i>	Passes your callback a pointer to space you allocated

##### Returns

Return `DW_DLV_OK` if the data is valid. If a serious error of some kind return `DW_DLV_ERROR`.

### 9.18.3 Function Documentation

#### 9.18.3.1 `dwarf_cie_section_offset()`

```
DW_API int dwarf_cie_section_offset (
    Dwarf_Debug dw_dbg,
    Dwarf_Cie dw_in_cie,
    Dwarf_Off * dw_cie_off,
    Dwarf_Error * dw_error )
```

Use to print CIE offsets from debugging info.

##### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest
<i>dw_in_cie</i>	Pass in the CIE of interest.
<i>dw_cie_off</i>	On success returns the section offset of the CIE.
<i>dw_error</i>	Error return details

##### Returns

Returns `DW_DLV_OK` etc.

### 9.18.3.2 dwarf\_dealloc\_fde\_cie\_list()

```
DW_API void dwarf_dealloc_fde_cie_list (
    Dwarf_Debug dw_dbg,
    Dwarf_Cie * dw_cie_data,
    Dwarf_Signed dw_cie_element_count,
    Dwarf_Fde * dw_fde_data,
    Dwarf_Signed dw_fde_element_count )
```

Release storage associated with FDE and CIE arrays.

Applies to .eh\_frame and .debug\_frame lists.

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug used in the list setup.
<i>dw_cie_data</i>	As returned from the list setup call.
<i>dw_cie_element_count</i>	
<i>dw_fde_data</i>	As returned from the list setup call.
<i>dw_fde_element_count</i>	As returned from the list setup call.

On return the pointers passed in *dw\_cie\_data* and *dw\_fde\_data* should be zeroed by the caller as they are then stale pointers.

### 9.18.3.3 dwarf\_dealloc\_frame\_instr\_head()

```
DW_API void dwarf_dealloc_frame_instr_head (
    Dwarf_Frame_Instr_Head dw_head )
```

Deallocates the frame instruction data in *dw\_head*.

#### Parameters

<i>dw_head</i>	A head pointer. Frees all data created by <a href="#">dwarf_expand_frame_instructions()</a> and makes the head pointer stale. The caller should set to NULL.
----------------	--

### 9.18.3.4 dwarf\_expand\_frame\_instructions()

```
DW_API int dwarf_expand_frame_instructions (
    Dwarf_Cie dw_cie,
    Dwarf_Small * dw_instructionspointer,
    Dwarf_Unsigned dw_length_in_bytes,
    Dwarf_Frame_Instr_Head * dw_head,
    Dwarf_Unsigned * dw_instr_count,
    Dwarf_Error * dw_error )
```

Expands CIE or FDE instructions for detailed examination. Called for CIE initial instructions and FDE instructions. Call [dwarf\\_get\\_fde\\_instr\\_bytes\(\)](#) or [dwarf\\_get\\_cie\\_info\\_b\(\)](#) to get the initial instruction bytes and instructions byte count you wish to expand.

Combined with [dwarf\\_get\\_frame\\_instruction\(\)](#) or [dwarf\\_get\\_frame\\_instruction\\_a\(\)](#) (the second is like the first but adds an argument for LLVM address space numbers) it enables detailed access to frame instruction fields for evaluation or printing.

Free allocated memory with [dwarf\\_dealloc\\_frame\\_instr\\_head\(\)](#).

See also

[Using dwarf\\_expand\\_frame\\_instructions](#)

#### Parameters

<i>dw_cie</i>	The cie relevant to the instructions.
<i>dw_instructionspointer</i>	points to the instructions
<i>dw_length_in_bytes</i>	byte length of the instruction sequence.
<i>dw_head</i>	The address of an allocated <i>dw_head</i>
<i>dw_instr_count</i>	Returns the number of instructions in the byte stream
<i>dw_error</i>	Error return details

#### Returns

On success returns DW\_DLV\_OK

#### 9.18.3.5 dwarf\_fde\_section\_offset()

```
DW_API int dwarf_fde_section_offset (
    Dwarf_Debug dw_dbg,
    Dwarf_Fde dw_in_fde,
    Dwarf_Off * dw_fde_off,
    Dwarf_Off * dw_cie_off,
    Dwarf_Error * dw_error )
```

Return FDE and CIE offsets from debugging info.

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest
<i>dw_in_fde</i>	Pass in the FDE of interest.
<i>dw_fde_off</i>	On success returns the section offset of the FDE.
<i>dw_cie_off</i>	On success returns the section offset of the CIE.
<i>dw_error</i>	Error return details

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.18.3.6 dwarf\_get\_cie\_augmentation\_data()

```
DW_API int dwarf_get_cie_augmentation_data (
    Dwarf_Cie dw_cie,
```

```
Dwarf_Small ** dw_augdata,
Dwarf_Unsigned * dw_augdata_len,
Dwarf_Error * dw_error )
```

Return .eh\_frame CIE augmentation data.

GNU .eh\_frame CIE augmentation information. See Linux Standard Base Core Specification version 3.0 .

See also

<https://gcc.gnu.org/legacy-ml/gcc/2003-12/msg01168.html>

#### Parameters

<i>dw_cie</i>	The CIE of interest.
<i>dw_augdata</i>	On success returns a pointer to the augmentation data.
<i>dw_augdata_len</i>	On success returns the length in bytes of the augmentation data.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc. If the augmentation data length is zero it returns DW\_DLV\_NO\_ENTRY.

### 9.18.3.7 dwarf\_get\_cie\_index()

```
DW_API int dwarf_get_cie_index (
    Dwarf_Cie dw_cie,
    Dwarf_Signed * dw_index,
    Dwarf_Error * dw_error )
```

Return CIE index given CIE.

#### Parameters

<i>dw_cie</i>	Pass in the CIE of interest.
<i>dw_index</i>	On success, returns the index (the position of the CIE in the CIE pointer array).
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.18.3.8 dwarf\_get\_cie\_info\_b()

```
DW_API int dwarf_get_cie_info_b (
    Dwarf_Cie dw_cie,
    Dwarf_Unsigned * dw_bytes_in_cie,
    Dwarf_Small * dw_version,
```

```

char ** dw_augmenter,
Dwarf_Unsigned * dw_code_alignment_factor,
Dwarf_Signed * dw_data_alignment_factor,
Dwarf_Half * dw_return_address_register_rule,
Dwarf_Small ** dw_initial_instructions,
Dwarf_Unsigned * dw_initial_instructions_length,
Dwarf_Half * dw_offset_size,
Dwarf_Error * dw_error )

```

Given a CIE get access to its content.

#### Parameters

<i>dw_cie</i>	Pass in the CIE of interest.
<i>dw_bytes_in_cie</i>	On success, returns the length of the CIE in bytes.
<i>dw_version</i>	On success, returns the CIE version number.
<i>dw_augmenter</i>	On success, returns a pointer to the augmentation string (which could be the empty string).
<i>dw_code_alignment_factor</i>	On success, returns a the code_alignment_factor used to interpret CIE/FDE operations.
<i>dw_data_alignment_factor</i>	On success, returns a the data_alignment_factor used to interpret CIE/FDE operations.
<i>dw_return_address_register_rule</i>	On success, returns a register number of the return address register.
<i>dw_initial_instructions</i>	On success, returns a pointer to the bytes of initial_instructions in the CIE.
<i>dw_initial_instructions_length</i>	On success, returns the length in bytes of the initial_instructions.
<i>dw_offset_size</i>	On success, returns the offset_size within this CIE.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.18.3.9 dwarf\_get\_cie\_of\_fde()

```

DW_API int dwarf_get_cie_of_fde (
    Dwarf_Fde dw_fde,
    Dwarf_Cie * dw_cie_returned,
    Dwarf_Error * dw_error )

```

Given FDE get CIE.

#### Parameters

<i>dw_fde</i>	The FDE of interest.
<i>dw_cie_returned</i>	On success returns a pointer to the applicable CIE.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.18.3.10 dwarf\_get\_fde\_at\_pc()

```
DW_API int dwarf_get_fde_at_pc (
    Dwarf_Fde * dw_fde_data,
    Dwarf_Addr dw_pc_of_interest,
    Dwarf_Fde * dw_returned_fde,
    Dwarf_Addr * dw_lopc,
    Dwarf_Addr * dw_hipc,
    Dwarf_Error * dw_error )
```

Retrieve an FDE given a pc.

Using binary search this finds the FDE that contains this dw\_pc\_of\_interest That works because libdwarf ensures the array of FDEs is sorted by the low-pc

See also

[dwarf\\_get\\_fde\\_list](#)

#### Parameters

<i>dw_fde_data</i>	Pass in a pointer an array of fde pointers.
<i>dw_pc_of_interest</i>	The pc value of interest.
<i>dw_returned_fde</i>	On success a pointer to the applicable FDE is set through the pointer.
<i>dw_lopc</i>	On success a pointer to the low pc in dw_returned_fde is set through the pointer.
<i>dw_hipc</i>	On success a pointer to the high pc (one past the actual last byte address) in dw_returned_fde is set through the pointer.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK if the dw\_pc\_of\_interest found in some FDE in the array. If no FDE is found containing dw\_pc\_of\_interest DW\_DLV\_NO\_ENTRY is returned.

### 9.18.3.11 dwarf\_get\_fde\_augmentation\_data()

```
DW_API int dwarf_get_fde_augmentation_data (
    Dwarf_Fde dw_fde,
    Dwarf_Small ** dw_augdata,
    Dwarf_Unsigned * dw_augdata_len,
    Dwarf_Error * dw_error )
```

Return .eh\_frame FDE augmentation data.

GNU .eh\_frame FDE augmentation information. See Linux Standard Base Core Specification version 3.0 .

See also

<https://gcc.gnu.org/legacy-ml/gcc/2003-12/msg01168.html>

## Parameters

<i>dw_fde</i>	The FDE of interest.
<i>dw_augdata</i>	On success returns a pointer to the augmentation data.
<i>dw_augdata_len</i>	On success returns the length in bytes of the augmentation data.
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc. If the augmentation data length is zero it returns DW\_DLV\_NO\_ENTRY.

**9.18.3.12 dwarf\_get\_fde\_exception\_info()**

```
DW_API int dwarf_get_fde_exception_info (
    Dwarf_Fde dw_fde,
    Dwarf_Signed * dw_offset_into_exception_tables,
    Dwarf_Error * dw_error )
```

IRIX only access to C++ destructor tables.

This applies only to IRIX C++ destructor information which was never documented and is unlikely to be of interest.

**9.18.3.13 dwarf\_get\_fde\_for\_die()**

```
DW_API int dwarf_get_fde_for_die (
    Dwarf_Debug dw_dbg,
    Dwarf_Die dw_subr_die,
    Dwarf_Fde * dw_returned_fde,
    Dwarf_Error * dw_error )
```

Get the fde given DW\_AT\_MIPS\_fde in a DIE.

This is essentially useless as only SGI/MIPS compilers from the 1990's had DW\_AT\_MIPS\_fde in DW\_TAG\_↵ subprogram DIEs and this relies on that attribute to work.

**9.18.3.14 dwarf\_get\_fde\_info\_for\_all\_regs3()**

```
DW_API int dwarf_get_fde_info_for_all_regs3 (
    Dwarf_Fde dw_fde,
    Dwarf_Addr dw_pc_requested,
    Dwarf_Regtable3 * dw_reg_table,
    Dwarf_Addr * dw_row_pc,
    Dwarf_Error * dw_error )
```

Return information on frame registers at a given pc value.

Identical to [dwarf\\_get\\_fde\\_info\\_for\\_all\\_regs3\\_b\(\)](#) except that this doesn't output dw\_has\_more\_rows and dw\_↵ subsequent\_pc, so [dwarf\\_get\\_fde\\_info\\_for\\_all\\_regs3\\_b\(\)](#) is a better choice.

If you need to iterate through all rows of the FDE, consider switching to [dwarf\\_get\\_fde\\_info\\_for\\_all\\_regs3\\_b\(\)](#) or [dwarf\\_iterate\\_fde\\_all\\_regs3\(\)](#).

### 9.18.3.15 dwarf\_get\_fde\_info\_for\_all\_regs3\_b()

```
DW_API int dwarf_get_fde_info_for_all_regs3_b (
    Dwarf_Fde dw_fde,
    Dwarf_Addr dw_pc_requested,
    Dwarf_Regtable3 * dw_reg_table,
    Dwarf_Addr * dw_row_pc,
    Dwarf_Bool * dw_has_more_rows,
    Dwarf_Addr * dw_subsequent_pc,
    Dwarf_Error * dw_error )
```

Return information on frame registers at a given pc value.

An FDE at a given pc (code address) This function is new in October 2023 version 0.9.0. See [libdwarf.h](#) for the required condition of dw\_reg\_table pointer passed in.

#### Parameters

<i>dw_fde</i>	Pass in the FDE of interest.
<i>dw_pc_requested</i>	Pass in a pc (code) address inside that FDE.
<i>dw_reg_table</i>	Pass in the address of a Dwarf_Regtable3 struct which has been initialized with zero bits, and for which the dw_rt3_rules array has been allocated and the initialized with all zero bits. On success, returns a filled in dw_reg_table given the frame state.
<i>dw_row_pc</i>	On success returns the address of the row of frame data which may be a few counts off of the pc requested.
<i>dw_has_more_rows</i>	On success returns FALSE if there are no more rows, otherwise returns TRUE.
<i>dw_subsequent_pc</i>	On success this returns the address of the next pc for which there is a register row, making access to all the rows in sequence much more efficient than just adding 1 to a pc value.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK if the dw\_pc\_requested is in the FDE passed in and there is some applicable row in the table.

### 9.18.3.16 dwarf\_get\_fde\_info\_for\_cfa\_reg3\_b()

```
DW_API int dwarf_get_fde_info_for_cfa_reg3_b (
    Dwarf_Fde dw_fde,
    Dwarf_Addr dw_pc_requested,
    Dwarf_Small * dw_value_type,
    Dwarf_Unsigned * dw_offset_relevant,
    Dwarf_Unsigned * dw_register,
    Dwarf_Unsigned * dw_offset,
    Dwarf_Block * dw_block,
    Dwarf_Addr * dw_row_pc_out,
    Dwarf_Bool * dw_has_more_rows,
    Dwarf_Addr * dw_subsequent_pc,
    Dwarf_Error * dw_error )
```

Get the value of the CFA for a particular pc value.

See also

[dwarf\\_get\\_fde\\_info\\_for\\_cfa\\_reg3\\_c](#)

This is the earlier version that returns a `dw_offset` of type `Dwarf_Unsigned`, requiring you to cast to `Dwarf_Signed` to work with the value.

### 9.18.3.17 dwarf\_get\_fde\_info\_for\_cfa\_reg3\_c()

```
DW_API int dwarf_get_fde_info_for_cfa_reg3_c (
    Dwarf_Fde dw_fde,
    Dwarf_Addr dw_pc_requested,
    Dwarf_Small * dw_value_type,
    Dwarf_Unsigned * dw_offset_relevant,
    Dwarf_Unsigned * dw_register,
    Dwarf_Signed * dw_offset,
    Dwarf_Block * dw_block,
    Dwarf_Addr * dw_row_pc_out,
    Dwarf_Bool * dw_has_more_rows,
    Dwarf_Addr * dw_subsequent_pc,
    Dwarf_Error * dw_error )
```

Get the value of the CFA for a particular pc value.

See also

[dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_c\(\)](#) has essentially the same return values as [dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_c](#) but it refers to the CFA (which is not part of the register table) so this function has no table column argument.

New in September 2023, release 0.8.0. [dwarf\\_get\\_fde\\_info\\_for\\_cfa\\_reg3\\_c\(\)](#) returns `dw_offset` as a signed type. [dwarf\\_get\\_fde\\_info\\_for\\_cfa\\_reg3\\_b\(\)](#) returns `dw_offset` as an unsigned type, requiring the caller to cast to `Dwarf_Signed` before using the value. Both versions exist and operate properly.

If `dw_value_type == DW_EXPR_EXPRESSION` or `DW_EXPR_VALUE_EXPRESSION` `dw_offset` is not set and the caller must evaluate the expression, which usually depends on runtime frame data which cannot be calculated without a stack frame including register values (etc).

### 9.18.3.18 dwarf\_get\_fde\_info\_for\_reg3\_b()

```
DW_API int dwarf_get_fde_info_for_reg3_b (
    Dwarf_Fde dw_fde,
    Dwarf_Half dw_table_column,
    Dwarf_Addr dw_pc_requested,
    Dwarf_Small * dw_value_type,
    Dwarf_Unsigned * dw_offset_relevant,
    Dwarf_Unsigned * dw_register,
    Dwarf_Unsigned * dw_offset,
    Dwarf_Block * dw_block_content,
    Dwarf_Addr * dw_row_pc_out,
    Dwarf_Bool * dw_has_more_rows,
    Dwarf_Addr * dw_subsequent_pc,
    Dwarf_Error * dw_error )
```

Return details about a particular pc and register.

Identical to [dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_c\(\)](#) except that this returns `dw_offset` as a `Dwarf_Unsigned`, which was never appropriate, and required you to cast that value to `Dwarf_Signed` to use it properly..

Please switch to using [dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_c\(\)](#)

### 9.18.3.19 dwarf\_get\_fde\_info\_for\_reg3\_c()

```
DW_API int dwarf_get_fde_info_for_reg3_c (
    Dwarf_Fde dw_fde,
    Dwarf_Half dw_table_column,
    Dwarf_Addr dw_pc_requested,
    Dwarf_Small * dw_value_type,
    Dwarf_Unsigned * dw_offset_relevant,
    Dwarf_Unsigned * dw_register,
    Dwarf_Signed * dw_offset,
    Dwarf_Block * dw_block_content,
    Dwarf_Addr * dw_row_pc_out,
    Dwarf_Bool * dw_has_more_rows,
    Dwarf_Addr * dw_subsequent_pc,
    Dwarf_Error * dw_error )
```

Return details about a particular pc and register.

It is efficient to iterate across all table\_columns (registers) using this function ([dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_c\(\)](#)).

Or if one wants the data for all frame rows one could instead call [dwarf\\_iterate\\_fde\\_all\\_regs3\(\)](#) and index into the data it fills in and returns via a callback function you write.

If `dw_value_type == DW_EXPR_EXPRESSION` or `DW_EXPR_VALUE_EXPRESSION` `dw_offset` is not set and the caller must evaluate the expression, which usually depends on runtime frame data which cannot be calculated without a stack frame including registers (etc).

[dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_c\(\)](#) is new in libdwarf 0.8.0. It corrects the incorrect type of the `dw_offset` argument in [dwarf\\_get\\_fde\\_info\\_for\\_reg3\\_b\(\)](#). Both versions operate correctly.

As of libdwarf 2.3.0 the CFA can be requested with `dw_table_column`. Previously the CFA was unavailable. By default the cfa pseudo register number is `DW_FRAME_CFA_COL` from [dwarf.h](#).

#### Parameters

<i>dw_fde</i>	Pass in the FDE of interest.
<i>dw_table_column</i>	Pass in the table_column, column numbers in the table are 0 through the number_of_registers-1 and the 'column' of the CFA (by default it is <code>DW_FRAME_CFA_COL</code> , but might have been set by your code using <a href="#">dwarf_set_frame_cfa_value()</a> ).
<i>dw_pc_requested</i>	Pass in the pc of interest within <code>dw_fde</code> .
<i>dw_value_type</i>	On success returns the value type, a <code>DW_EXPR</code> value. For example <code>DW_EXPR_EXPRESSION</code>
<i>dw_offset_relevant</i>	On success returns FALSE if the offset value is irrelevant, otherwise TRUE.
<i>dw_register</i>	On success returns a register number.
<i>dw_offset</i>	On success returns a signed register offset value when <code>dw_value_type</code> is <code>DW_EXPR_OFFSET</code> or <code>DW_EXPR_VAL_OFFSET</code> .
<i>dw_block_content</i>	On success returns a pointer to a block. For example, for <code>DW_EXPR_EXPRESSION</code> the block gives access to the expression bytes.
<i>dw_row_pc_out</i>	On success returns the address of the actual pc for this register at this pc.
<i>dw_has_more_rows</i>	On success returns FALSE if there are no more rows, otherwise returns TRUE.
<i>dw_subsequent_pc</i>	On success this returns the address of the next pc for which there is a register row, making access to all the rows in sequence much more efficient than just adding 1 to a pc value.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK if the dw\_pc\_requested is in the FDE passed in and there is a row for the pc in the table.

**9.18.3.20 dwarf\_get\_fde\_instr\_bytes()**

```
DW_API int dwarf_get_fde_instr_bytes (
    Dwarf_Fde dw_fde,
    Dwarf_Small ** dw_outinstrs,
    Dwarf_Unsigned * dw_outlen,
    Dwarf_Error * dw_error )
```

Return length and pointer to access frame instructions.

**See also**

[dwarf\\_expand\\_frame\\_instructions](#)

[Using dwarf\\_expand\\_frame\\_instructions](#)

**Parameters**

<i>dw_fde</i>	Pass in the FDE of interest.
<i>dw_outinstrs</i>	On success returns a pointer to the FDE instruction byte stream.
<i>dw_outlen</i>	On success returns the length of the dw_outinstrs byte stream.
<i>dw_error</i>	The usual error detail return pointer.

**Returns**

Returns DW\_DLV\_OK etc.

**9.18.3.21 dwarf\_get\_fde\_list()**

```
DW_API int dwarf_get_fde_list (
    Dwarf_Debug dw_dbg,
    Dwarf_Cie ** dw_cie_data,
    Dwarf_Signed * dw_cie_element_count,
    Dwarf_Fde ** dw_fde_data,
    Dwarf_Signed * dw_fde_element_count,
    Dwarf_Error * dw_error )
```

Get lists of .debug\_frame FDEs and CIEs.

See DWARF5 Section 6.4 Call Frame Information, page 171.

see [doc/checkexamples.c](#) exampleq()

**See also**

[Extracting fde, cie lists.](#)

The FDE array returned through dw\_fde\_data is sorted low-to-high by the lowest-pc in each FDE.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_cie_data</i>	On success returns a pointer to an array of pointers to CIE data.
<i>dw_cie_element_count</i>	On success returns a count of the number of elements in the <i>dw_cie_data</i> array.
<i>dw_fde_data</i>	On success returns a pointer to an array of pointers to FDE data.
<i>dw_fde_element_count</i>	On success returns a count of the number of elements in the <i>dw_fde_data</i> array. On success
<i>dw_error</i>	The usual error detail return pointer.

## Returns

Returns DW\_DLV\_OK etc.

**9.18.3.22 dwarf\_get\_fde\_list\_eh()**

```
DW_API int dwarf_get_fde_list_eh (
    Dwarf_Debug dw_dbg,
    Dwarf_Cie ** dw_cie_data,
    Dwarf_Signed * dw_cie_element_count,
    Dwarf_Fde ** dw_fde_data,
    Dwarf_Signed * dw_fde_element_count,
    Dwarf_Error * dw_error )
```

Get lists of .eh\_frame FDEs and CIEs.

The arguments are identical to the previous function, the difference is the section read. The GNU-defined .eh\_frame section is very similar to .debug\_frame but has unique features that matter when following a stack trace.

## See also

[dwarf\\_get\\_fde\\_list](#)

**9.18.3.23 dwarf\_get\_fde\_n()**

```
DW_API int dwarf_get_fde_n (
    Dwarf_Fde * dw_fde_data,
    Dwarf_Unsigned dw_fde_index,
    Dwarf_Fde * dw_returned_fde,
    Dwarf_Error * dw_error )
```

Retrieve an FDE from an FDE table.

This is just like indexing into the FDE array but with extra checking of the pointer and index.

## See also

[dwarf\\_get\\_fde\\_list](#)

### 9.18.3.24 dwarf\_get\_fde\_range()

```
DW_API int dwarf_get_fde_range (
    Dwarf_Fde dw_fde,
    Dwarf_Addr * dw_low_pc,
    Dwarf_Unsigned * dw_func_length,
    Dwarf_Small ** dw_fde_bytes,
    Dwarf_Unsigned * dw_fde_byte_length,
    Dwarf_Off * dw_cie_offset,
    Dwarf_Signed * dw_cie_index,
    Dwarf_Off * dw_fde_offset,
    Dwarf_Error * dw_error )
```

Return the FDE data for a single FDE.

#### Parameters

<i>dw_fde</i>	The FDE of interest.
<i>dw_low_pc</i>	On success returns the low pc value for the function involved.
<i>dw_func_length</i>	On success returns the length of the function code in bytes.
<i>dw_fde_bytes</i>	On success returns a pointer to the bytes of the FDE.
<i>dw_fde_byte_length</i>	On success returns the length of the <i>dw_fde_bytes</i> area.
<i>dw_cie_offset</i>	On success returns the section offset of the associated CIE.
<i>dw_cie_index</i>	On success returns the CIE index of the associated CIE.
<i>dw_fde_offset</i>	On success returns the section offset of this FDE.
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.18.3.25 dwarf\_get\_frame\_instruction()

```
DW_API int dwarf_get_frame_instruction (
    Dwarf_Frame_Instr_Head dw_head,
    Dwarf_Unsigned dw_instr_index,
    Dwarf_Unsigned * dw_instr_offset_in_instrs,
    Dwarf_Small * dw_cfa_operation,
    const char ** dw_fields_description,
    Dwarf_Unsigned * dw_u0,
    Dwarf_Unsigned * dw_u1,
    Dwarf_Signed * dw_s0,
    Dwarf_Signed * dw_s1,
    Dwarf_Unsigned * dw_code_alignment_factor,
    Dwarf_Signed * dw_data_alignment_factor,
    Dwarf_Block * dw_expression_block,
    Dwarf_Error * dw_error )
```

Return information about a single instruction. Fields\_description means a sequence of up to three letters including u,s,r,c,d,b, terminated by NUL byte. It is a string but we test individual bytes instead of using string compares. Do not free any of the returned values.

#### See also

[Using dwarf\\_expand\\_frame\\_instructions](#)

## Parameters

<i>dw_head</i>	A head record
<i>dw_instr_index</i>	index $0 < i < \text{instr\_count}$
<i>dw_instr_offset_in_instrs</i>	Returns the byte offset of this instruction within instructions.
<i>dw_cfa_operation</i>	Returns a DW_CFA opcode.
<i>dw_fields_description</i>	Returns a string. Do not free.
<i>dw_u0</i>	May be set to an unsigned value
<i>dw_u1</i>	May be set to an unsigned value
<i>dw_s0</i>	May be set to a signed value
<i>dw_s1</i>	May be set to a signed value
<i>dw_code_alignment_factor</i>	May be set by the call
<i>dw_data_alignment_factor</i>	May be set by the call
<i>dw_expression_block</i>	Pass in a pointer to a block
<i>dw_error</i>	If DW_DLV_ERROR and the argument is non-NULL, returns details about the error.

## Returns

On success returns DW\_DLV\_OK If there is no such instruction with that index it returns DW\_DLV\_NO\_ENTRY  
On error it returns DW\_DLV\_ERROR and if dw\_error is NULL it pushes back a pointer to a Dwarf\_Error to the caller.

Frame expressions have a variety of formats and content. The dw\_fields parameter is set to a pointer to a short string with some set of the letters s,u,r,d,c,b,a which enables determining exactly which values the call sets. Some examples: A s in fields[0] means s0 is a signed number.

A b somewhere in fields means the expression block passed in has been filled in.

A r in fields[1] means u1 is set to a register number.

A d in fields means data\_alignment\_factor is set

A c in fields means code\_alignment\_factor is set

An a in fields means an LLVM address space value and only exists if calling [dwarf\\_get\\_frame\\_instruction\\_a\(\)](#).

The possible frame instruction formats are:

```
" " "b" "r" "rb" "rr" "rsd" "rsda" "ru" "rua" "rud"
"sd" "u" "uc"
```

are the possible frame instruction formats.

### 9.18.3.26 dwarf\_get\_frame\_instruction\_a()

```
DW_API int dwarf_get_frame_instruction_a (
    Dwarf_Frame_Instr_Head dw_,
    Dwarf_Unsigned dw_instr_index,
    Dwarf_Unsigned * dw_instr_offset_in_instrs,
    Dwarf_Small * dw_cfa_operation,
    const char ** dw_fields_description,
    Dwarf_Unsigned * dw_u0,
    Dwarf_Unsigned * dw_u1,
    Dwarf_Unsigned * dw_u2,
```

```

Dwarf_Signed * dw_s0,
Dwarf_Signed * dw_s1,
Dwarf_Unsigned * dw_code_alignment_factor,
Dwarf_Signed * dw_data_alignment_factor,
Dwarf_Block * dw_expression_block,
Dwarf_Error * dw_error )

```

Expands CIE or FDE instructions for detailed examination. Called for CIE initial instructions and FDE instructions. This is the same as [dwarf\\_get\\_frame\\_instruction\(\)](#) except that it adds a `dw_u2` field which contains an address-space identifier if the letter `a` appears in `dw_fields_description`. The `dw_u2` field is non-standard and only applies to Heterogeneous Debugging frame instructions defined by LLVM (`DW_CFA_LLVM_def_aspace_cfa` and `DW_CFA_LLVM_def_aspace_cfa_sf`)

Where multiplication is called for (via `dw_code_alignment_factor` or `dw_data_alignment_factor`) to produce an offset there is no need to check for overflow as libdwarf has already verified there is no overflow.

The return values are the same except here we have: an `a` in `fields[2]` or `fields[3]` means `dw_u2` is an address-space identifier for the LLVM CFA instruction.

### 9.18.3.27 dwarf\_iterate\_fde\_all\_regs3()

```

DW_API int dwarf_iterate_fde_all_regs3 (
    Dwarf_Fde dw_fde,
    Dwarf_Regtable3 * dw_reg_table,
    dwarf_iterate_fde_callback_function_type dw_callback,
    void * dw_callback_user_data,
    Dwarf_Error * dw_error )

```

Iterate all rows for a given FDE. Invokes a provided callback function for each row. Iteration continues until all rows have been visited.

This is much more efficient than repeatedly calling [dwarf\\_get\\_fde\\_info\\_for\\_all\\_regs3\\_b\(\)](#) when you need to extract all rows of an FDE. See `dwarfexample/frame2.c` for an example of its use.

#### Parameters

<i>dw_fde</i>	Pass in the FDE of interest.
<i>dw_reg_table</i>	Pass in the address of a struct to be filled in and returned via the callback with fde row data for the current row. The struct should be all zeros. The array of struct <a href="#">Dwarf_Regtable_Entry3_s</a> for register rules in the struct must have been allocated and initialized with all zero bits.
<i>dw_callback</i>	The callback that should be invoked for each row in the FDE. The register table of size <code>@dw_reg_table_size</code> is passed to the callback.
<i>dw_callback_user_data</i>	User data that is passed to the callback
<i>dw_error</i>	The usual error detail return pointer.

#### Returns

Returns `DW_DLV_OK` if iterations all succeeded

### 9.18.3.28 dwarf\_set\_frame\_cfa\_value()

```

DW_API Dwarf_Half dwarf_set_frame_cfa_value (

```

```
Dwarf_Debug dw_dbg,
Dwarf_Half dw_value )
```

Frame CFA Column [Invariants for setting frame registers](#) .

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_value</i>	Pass in the value to record for the library to use. If zero, the Frame CFA_Column is left unchanged.

#### Returns

Returns the previous value.

### 9.18.3.29 dwarf\_set\_frame\_rule\_initial\_value()

```
DW_API Dwarf_Half dwarf_set_frame_rule_initial_value (
    Dwarf_Debug dw_dbg,
    Dwarf_Half dw_value )
```

Frame Rule Initial Value.

[Invariants for setting frame registers](#)

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_value</i>	Pass in the value to record for the library to use. If zero, the Frame Rule Initial Value is left unchanged.

#### Returns

Returns the previous value.

### 9.18.3.30 dwarf\_set\_frame\_rule\_table\_size()

```
DW_API Dwarf_Half dwarf_set_frame_rule_table_size (
    Dwarf_Debug dw_dbg,
    Dwarf_Half dw_value )
```

Frame Rule Table Size [Invariants for setting frame registers](#) .

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_value</i>	Pass in the value to record for the library to use. If zero, the Frame Rule Table Size is left unchanged. The library someone arbitrarily does not allow setting the number of register rules (registers) below 188 (DW_FRAME_HIGHEST_NORMAL_REGISTER in <a href="#">dwarf.h</a> ) and does not apply any dw_value lower than that.

**Returns**

Returns the previous value.

**9.18.3.31 dwarf\_set\_frame\_same\_value()**

```
DW_API Dwarf_Half dwarf_set_frame_same_value (
    Dwarf_Debug dw_dbg,
    Dwarf_Half dw_value )
```

Frame Same Value Default [Invariants for setting frame registers](#) .

**Parameters**

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_value</i>	Pass in the value to record for the library to use. If zero, the Frame Same Value Default is left unchanged.

**Returns**

Returns the previous value.

**9.18.3.32 dwarf\_set\_frame\_undefined\_value()**

```
DW_API Dwarf_Half dwarf_set_frame_undefined_value (
    Dwarf_Debug dw_dbg,
    Dwarf_Half dw_value )
```

Frame Undefined Value Default [Invariants for setting frame registers](#) .

**Parameters**

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_value</i>	Pass in the value to record for the library to use. If zero, the Frame Undefined Value Default is left unchanged.

**Returns**

Returns the previous value.

**9.19 Abbreviations Section Details****Functions**

- DW\_API int [dwarf\\_get\\_abbrev](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Unsigned dw\_offset, Dwarf\_Abbrev \*dw\_↵ returned\_abbrev, Dwarf\_Unsigned \*dw\_length, Dwarf\_Unsigned \*dw\_attr\_count, Dwarf\_Error \*dw\_error)  
*Reading Abbreviation Data.*

*Get Abbrev Entry Details.*

### 9.19.1 Detailed Description

Allows reading section `.debug_abbrev` independently of CUs or DIEs. Normally not done (libdwarf uses it as necessary to access DWARF DIEs and DWARF attributes) unless one is interested in the content of the section.

[About Reading Independently.](#)

### 9.19.2 Function Documentation

#### 9.19.2.1 `dwarf_get_abbrev()`

```
DW_API int dwarf_get_abbrev (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_offset,
    Dwarf_Abbrev * dw_returned_abbrev,
    Dwarf_Unsigned * dw_length,
    Dwarf_Unsigned * dw_attr_count,
    Dwarf_Error * dw_error )
```

Reading Abbreviation Data.

Normally you never need to call these functions. Calls that involve DIEs do all this for you behind the scenes in the library.

This reads the data for a single abbrev code starting at `dw_offset`. Essentially, opening access to an abbreviation entry.

When libdwarf itself reads abbreviations to access DIEs the offset comes from the Compilation Unit Header `debug_abbrev_offset` field.

See also

[dwarf\\_next\\_cu\\_header\\_e](#)

#### Parameters

<code>dw_dbg</code>	The Dwarf_Debug of interest.
<code>dw_offset</code>	Pass in the offset where a Debug_Abbrev starts.
<code>dw_returned_abbrev</code>	On success, sets a pointer to a Dwarf_Abbrev through the pointer to allow further access. <span style="float: right;">Generated by Doxygen</span>
<code>dw_length</code>	On success, returns the length of the entire abbreviation block (bytes), useful to calculate the next offset if reading the section independently of any compilation unit.
<code>dw_attr_count</code>	On success, returns the number of attributes in this abbreviation entry

**Returns**

The usual value: DW\_DLV\_OK etc. If the abbreviation is a single zero byte it is a null abbreviation. DW\_DLV\_OK is returned.

Close the abbrev by calling dwarf\_dealloc(dbg,\*dw\_returned\_abbrev, DW\_DLA\_ABBREV)

**9.19.2.2 dwarf\_get\_abbrev\_children\_flag()**

```
DW_API int dwarf_get_abbrev_children_flag (
    Dwarf_Abbrev dw_abbrev,
    Dwarf_Signed * dw_return_flag,
    Dwarf_Error * dw_error )
```

Get Abbrev Children Flag.

**Parameters**

<i>dw_abbrev</i>	The Dwarf_Abbrev of interest.
<i>dw_return_flag</i>	On success returns the flag TRUE (greater than zero) if the DIE referencing the abbreviation has children, else returns FALSE (zero).
<i>dw_error</i>	On error dw_error is set to point to the error details.

**Returns**

The usual value: DW\_DLV\_OK etc.

**9.19.2.3 dwarf\_get\_abbrev\_code()**

```
DW_API int dwarf_get_abbrev_code (
    Dwarf_Abbrev dw_abbrev,
    Dwarf_Unsigned * dw_return_code_number,
    Dwarf_Error * dw_error )
```

Get Abbreviation Code.

**Parameters**

<i>dw_abbrev</i>	The Dwarf_Abbrev of interest.
<i>dw_return_code_number</i>	Returns the code for this abbreviation, a number assigned to the abbreviation and unique within the applicable CU.
<i>dw_error</i>	On error dw_error is set to point to the error details.

**Returns**

The usual value: DW\_DLV\_OK etc.

**9.19.2.4 dwarf\_get\_abbrev\_entry\_b()**

```
DW_API int dwarf_get_abbrev_entry_b (
```

```

Dwarf_Abbrev dw_abbrev,
Dwarf_Unsigned dw_indx,
Dwarf_Bool dw_filter_outliers,
Dwarf_Unsigned * dw_returned_attr_num,
Dwarf_Unsigned * dw_returned_form,
Dwarf_Signed * dw_returned_implicit_const,
Dwarf_Off * dw_offset,
Dwarf_Error * dw_error )

```

Get Abbrev Entry Details.

Most will call with filter\_outliers non-zero.

#### Parameters

<i>dw_abbrev</i>	The Dwarf_Abbrev of interest.
<i>dw_indx</i>	Valid dw_index values are 0 through dw_attr_count-1
<i>dw_filter_outliers</i>	Pass non-zero (TRUE) so the function will check for unreasonable abbreviation content and return DW_DLV_ERROR if such found. If zero (FALSE) passed in even a nonsensical attribute number and/or unknown DW_FORM are allowed (used by dwarfdump to report the issue(s)).
<i>dw_returned_attr_num</i>	On success returns the attribute number, such as DW_AT_name
<i>dw_returned_form</i>	On success returns the attribute FORM, such as DW_FORM_uda
<i>dw_returned_implicit_const</i>	On success, if the dw_returned_form is DW_FORM_implicit_const then dw_returned_implicit_const is the implicit const value, but if not implicit const the return value is zero..
<i>dw_offset</i>	On success returns the offset of the start of this attr/form pair in the abbreviation section.
<i>dw_error</i>	On error dw_error is set to point to the error details.

#### Returns

The usual value: DW\_DLV\_OK etc. If the abbreviation code for this Dwarf\_Abbrev is 0 it is a null abbreviation, the dw\_indx is ignored, and the function returns DW\_DLV\_NO\_ENTRY.

### 9.19.2.5 dwarf\_get\_abbrev\_tag()

```

DW_API int dwarf_get_abbrev_tag (
    Dwarf_Abbrev dw_abbrev,
    Dwarf_Half * dw_return_tag_number,
    Dwarf_Error * dw_error )

```

Get abbreviation tag.

#### Parameters

<i>dw_abbrev</i>	The Dwarf_Abbrev of interest.
<i>dw_return_tag_number</i>	Returns the tag value, for example DW_TAG_compile_unit.
<i>dw_error</i>	On error dw_error is set to point to the error details.

**Returns**

The usual value: DW\_DLV\_OK etc.

## 9.20 String Section .debug\_str Details

**Functions**

- DW\_API int [dwarf\\_get\\_str](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Off](#) dw\_offset, char \*\*dw\_string, [Dwarf\\_Signed](#) \*dw\_strlen\_of\_string, [Dwarf\\_Error](#) \*dw\_error)

*Reading From a String Section.*

### 9.20.1 Detailed Description

Shows just the section content in detail

### 9.20.2 Function Documentation

#### 9.20.2.1 dwarf\_get\_str()

```
DW_API int dwarf_get_str (
    Dwarf_Debug dw_dbg,
    Dwarf_Off dw_offset,
    char ** dw_string,
    Dwarf_Signed * dw_strlen_of_string,
    Dwarf_Error * dw_error )
```

Reading From a String Section.

#### [Reading The String Section](#)

**Parameters**

<i>dw_dbg</i>	The Dwarf_Debug whose .debug_str section we want to access.
<i>dw_offset</i>	Pass in a string offset. Start at 0, and for the next call pass in dw_offset plus dw_strlen_of_string plus 1.
<i>dw_string</i>	The caller must pass in a valid pointer to a char *. On success returns a pointer to a string from offset dw_offset. Never dealloc or free this string.
<i>dw_strlen_of_string</i>	The caller must pass in a valid pointer to a Dwarf_Signed.

On success returns the strlen() of the string.

**Parameters**

<i>dw_error</i>	On error dw_error is set to point to the error details.
-----------------	---

## Returns

The usual value: DW\_DLV\_OK etc. If there is no such section it returns DW\_DLV\_NO\_ENTRY. If the `dw_offset` is greater than the section size, or `dw_string` passed in is NULL or `dw_strlen_of_string` is NULL the function returns DW\_DLV\_ERROR.

## 9.21 Str\_Offsets section details

### Functions

- DW\_API int [dwarf\\_open\\_str\\_offsets\\_table\\_access](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Str\_Offsets\_Table \*dw\_table\_data, Dwarf\_Error \*dw\_error)  
*Creates access to a .debug\_str\_offsets table.*
- DW\_API int [dwarf\\_close\\_str\\_offsets\\_table\\_access](#) (Dwarf\_Str\_Offsets\_Table dw\_table\_data, Dwarf\_Error \*dw\_error)  
*Close str\_offsets access, free table\_data.*
- DW\_API int [dwarf\\_next\\_str\\_offsets\\_table](#) (Dwarf\_Str\_Offsets\_Table dw\_table\_data, Dwarf\_Unsigned \*dw\_unit\_length, Dwarf\_Unsigned \*dw\_unit\_length\_offset, Dwarf\_Unsigned \*dw\_table\_start\_offset, Dwarf\_Half \*dw\_entry\_size, Dwarf\_Half \*dw\_version, Dwarf\_Half \*dw\_padding, Dwarf\_Unsigned \*dw\_table\_value\_count, Dwarf\_Error \*dw\_error)  
*Iterate through the offsets tables.*
- DW\_API int [dwarf\\_str\\_offsets\\_value\\_by\\_index](#) (Dwarf\_Str\_Offsets\_Table dw\_table\_data, Dwarf\_Unsigned dw\_index\_to\_entry, Dwarf\_Unsigned \*dw\_entry\_value, Dwarf\_Error \*dw\_error)  
*Access to an individual str offsets table entry.*
- DW\_API int [dwarf\\_str\\_offsets\\_statistics](#) (Dwarf\_Str\_Offsets\_Table dw\_table\_data, Dwarf\_Unsigned \*dw\_wasted\_byte\_count, Dwarf\_Unsigned \*dw\_table\_count, Dwarf\_Error \*dw\_error)  
*Reports final wasted-bytes count.*

### 9.21.1 Detailed Description

Shows just the section content in detail. Most library users will never call these, as references to this is handled by the code accessing some Dwarf\_Attribute. [Reading The Str\\_Offsets](#)

### 9.21.2 Function Documentation

#### 9.21.2.1 dwarf\_close\_str\_offsets\_table\_access()

```
DW_API int dwarf_close_str_offsets_table_access (
    Dwarf_Str_Offsets_Table dw_table_data,
    Dwarf_Error * dw_error )
```

Close str\_offsets access, free table\_data.

#### See also

[Reading string offsets section data](#)

## Parameters

<i>dw_table_data</i>	
<i>dw_error</i>	On error <i>dw_error</i> is set to point to the error details.

## Returns

DW\_DLV\_OK etc. If there is no .debug\_str\_offsets section it returns DW\_DLV\_NO\_ENTRY If it returns DW\_DLV\_ERROR there is nothing you can do except report the error and, optionally, call dwarf\_dealloc\_error to dealloc the error content (and then set the *dw\_error* to NULL as after the dealloc the pointer is stale)..

## 9.21.2.2 dwarf\_next\_str\_offsets\_table()

```
DW_API int dwarf_next_str_offsets_table (
    Dwarf_Str_Offsets_Table dw_table_data,
    Dwarf_Unsigned * dw_unit_length,
    Dwarf_Unsigned * dw_unit_length_offset,
    Dwarf_Unsigned * dw_table_start_offset,
    Dwarf_Half * dw_entry_size,
    Dwarf_Half * dw_version,
    Dwarf_Half * dw_padding,
    Dwarf_Unsigned * dw_table_value_count,
    Dwarf_Error * dw_error )
```

Iterate through the offsets tables.

## See also

[Reading string offsets section data](#)

Access to the tables starts at offset zero. The library progresses through the next table automatically, keeping track internally to know where it is.

## Parameters

<i>dw_table_data</i>	Pass in an open Dwarf_Str_Offsets_Table.
<i>dw_unit_length</i>	On success returns a table unit_length field
<i>dw_unit_length_offset</i>	On success returns the section offset of the unit_length field.
<i>dw_table_start_offset</i>	On success returns the section offset of the array of table entries.
<i>dw_entry_size</i>	On success returns the entry size (4 or 8)
<i>dw_version</i>	On success returns the value in the version field 5.
<i>dw_padding</i>	On success returns the zero value in the padding field.
<i>dw_table_value_count</i>	On success returns the number of table entries, each of size <i>dw_entry_size</i> , in the table.
<i>dw_error</i>	On error <i>dw_error</i> is set to point to the error details.

## Returns

DW\_DLV\_OK Returns DW\_DLV\_NO\_ENTRY if there are no more entries.

### 9.21.2.3 dwarf\_open\_str\_offsets\_table\_access()

```
DW_API int dwarf_open_str_offsets_table_access (
    Dwarf_Debug dw_dbg,
    Dwarf_Str_Offsets_Table * dw_table_data,
    Dwarf_Error * dw_error )
```

Creates access to a .debug\_str\_offsets table.

See also

[Reading string offsets section data](#)

#### Parameters

<i>dw_dbg</i>	Pass in the Dwarf_Debug of interest.
<i>dw_table_data</i>	On success returns a pointer to an opaque structure for use in further calls.
<i>dw_error</i>	On error dw_error is set to point to the error details.

#### Returns

DW\_DLV\_OK etc. If there is no .debug\_str\_offsets section it returns DW\_DLV\_NO\_ENTRY

### 9.21.2.4 dwarf\_str\_offsets\_statistics()

```
DW_API int dwarf_str_offsets_statistics (
    Dwarf_Str_Offsets_Table dw_table_data,
    Dwarf_Unsigned * dw_wasted_byte_count,
    Dwarf_Unsigned * dw_table_count,
    Dwarf_Error * dw_error )
```

Reports final wasted-bytes count.

Reports the number of tables seen so far. Not very interesting.

#### Parameters

<i>dw_table_data</i>	Pass in the open table pointer.
<i>dw_wasted_byte_count</i>	Always returns 0 at present.
<i>dw_table_count</i>	On success returns the total number of tables seen so far in the section.
<i>dw_error</i>	On error dw_error is set to point to the error details.

#### Returns

DW\_DLV\_OK etc.

### 9.21.2.5 dwarf\_str\_offsets\_value\_by\_index()

```
DW_API int dwarf_str_offsets_value_by_index (
    Dwarf_Str_Offsets_Table dw_table_data,
```

```
Dwarf_Unsigned dw_index_to_entry,
Dwarf_Unsigned * dw_entry_value,
Dwarf_Error * dw_error )
```

Access to an individual str offsets table entry.

See also

[Reading string offsets section data](#)

#### Parameters

<i>dw_table_data</i>	Pass in the open table pointer.
<i>dw_index_to_entry</i>	Pass in the entry number, 0 through dw_table_value_count-1 for the active table
<i>dw_entry_value</i>	On success returns the value in that table entry, an offset into a string table.
<i>dw_error</i>	On error dw_error is set to point to the error details.

#### Returns

DW\_DLX\_OK Returns DW\_DLX\_ERROR if dw\_index\_to\_entry is out of the correct range.

## 9.22 Dwarf\_Error Functions

### Functions

- DW\_API [Dwarf\\_Unsigned dwarf\\_errno](#) ([Dwarf\\_Error](#) dw\_error)  
*What DW\_DLE code does the error have?*
- DW\_API char \* [dwarf\\_errmsg](#) ([Dwarf\\_Error](#) dw\_error)  
*What message string is in the error?*
- DW\_API char \* [dwarf\\_errmsg\\_by\\_number](#) ([Dwarf\\_Unsigned](#) dw\_errnum)  
*What message string is associated with the error number.*
- DW\_API void [dwarf\\_error\\_creation](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Error](#) \*dw\_error, char \*dw\_errmsg)  
*Creating an error. This is very rarely helpful. It lets the library user create a Dwarf\_Error and associate any string with that error. Your code could then return DW\_DLX\_ERROR to your caller when your intent is to let your caller clean up whatever seems wrong.*
- DW\_API void [dwarf\\_dealloc\\_error](#) ([Dwarf\\_Debug](#) dw\_dbg, [Dwarf\\_Error](#) dw\_error)  
*Free (dealloc) an Dwarf\_Error something created.*

### 9.22.1 Detailed Description

These functions aid in understanding handling.

### 9.22.2 Function Documentation

#### 9.22.2.1 dwarf\_dealloc\_error()

```
DW_API void dwarf_dealloc_error (
    Dwarf_Debug dw_dbg,
    Dwarf_Error dw_error )
```

Free (dealloc) an Dwarf\_Error something created.

## Parameters

<i>dw_dbg</i>	The relevant Dwarf_Debug pointer.
<i>dw_error</i>	A pointer to a Dwarf_Error. The pointer is then stale so you should immediately zero that pointer passed in.

**9.22.2.2 dwarf\_errmsg()**

```
DW_API char * dwarf_errmsg (
    Dwarf_Error dw_error )
```

What message string is in the error?

## Parameters

<i>dw_error</i>	The dw_error should be non-null and a valid Dwarf_Error.
-----------------	--

## Returns

A string with a message related to the error.

**9.22.2.3 dwarf\_errmsg\_by\_number()**

```
DW_API char * dwarf_errmsg_by_number (
    Dwarf_Unsigned dw_errornum )
```

What message string is associated with the error number.

## Parameters

<i>dw_errornum</i>	The dw_error should be an integer from the DW_DLE set. For example, DW_DLE_DIE_NULL.
--------------------	--

## Returns

The generic string describing that error number.

**9.22.2.4 dwarf\_errno()**

```
DW_API Dwarf_Unsigned dwarf_errno (
    Dwarf_Error dw_error )
```

What DW\_DLE code does the error have?

## Parameters

<i>dw_error</i>	The dw_error should be non-null and a valid Dwarf_Error.
-----------------	--

**Returns**

A DW\_DLE value of some kind. For example: DW\_DLE\_DIE\_NULL.

**9.22.2.5 dwarf\_error\_creation()**

```
DW_API void dwarf_error_creation (
    Dwarf_Debug dw_dbg,
    Dwarf_Error * dw_error,
    char * dw_errmsg )
```

Creating an error. This is very rarely helpful. It lets the library user create a Dwarf\_Error and associate any string with that error. Your code could then return DW\_DLV\_ERROR to your caller when your intent is to let your caller clean up whatever seems wrong.

**Parameters**

<i>dw_dbg</i>	The relevant Dwarf_Debug.
<i>dw_error</i>	a Dwarf_Error is returned through this pointer.
<i>dw_errmsg</i>	The message string you provide.

**9.23 Generic dwarf\_dealloc Function****Functions**

- DW\_API void [dwarf\\_dealloc](#) ([Dwarf\\_Debug](#) dw\_dbg, void \*dw\_space, [Dwarf\\_Unsigned](#) dw\_type)  
*The generic dealloc (free) function. It requires you know the correct DW\_DLA value to pass in, and in a few cases such is not provided. The functions doing allocations tell you which dealloc to use.*

**9.23.1 Detailed Description**

Works for most dealloc needed.

For easier to use versions see the following

**See also**

[dwarf\\_dealloc\\_attribute](#)  
[dwarf\\_dealloc\\_die](#)  
[dwarf\\_dealloc\\_dnames](#)  
[dwarf\\_dealloc\\_error](#)  
[dwarf\\_dealloc\\_fde\\_cie\\_list](#)  
[dwarf\\_dealloc\\_frame\\_instr\\_head](#)  
[dwarf\\_dealloc\\_macro\\_context](#)  
[dwarf\\_dealloc\\_ranges](#)  
[dwarf\\_dealloc\\_rnglists\\_head](#)  
[dwarf\\_dealloc\\_uncompressed\\_block](#)  
[dwarf\\_globals\\_dealloc](#)  
[dwarf\\_gnu\\_index\\_dealloc](#)  
[dwarf\\_loc\\_head\\_c\\_dealloc](#)  
[dwarf\\_srclines\\_dealloc\\_b](#)

## 9.23.2 Function Documentation

### 9.23.2.1 dwarf\_dealloc()

```
DW_API void dwarf_dealloc (
    Dwarf_Debug dw_dbg,
    void * dw_space,
    Dwarf_Unsigned dw_type )
```

The generic dealloc (free) function. It requires you know the correct DW\_DLA value to pass in, and in a few cases such is not provided. The functions doing allocations tell you which dealloc to use.

#### Parameters

<i>dw_dbg</i>	Must be a valid open Dwarf_Debug. and must be the dw_dbg that the error was created on. If it is not the dealloc will do nothing.
<i>dw_space</i>	Must be an address returned directly by a libdwarf call that the call specifies as requiring dealloc/free. If it is not a segfault or address fault is possible.
<i>dw_type</i>	Must be a correct naming of the DW_DLA type. If it is not the dealloc will do nothing.

## 9.24 Access to Section .debug\_sup

### Functions

- DW\_API int dwarf\_get\_debug\_sup (Dwarf\_Debug dw\_dbg, Dwarf\_Half \*dw\_version, Dwarf\_Small \*dw\_is\_supplementary, char \*\*dw\_filename, Dwarf\_Unsigned \*dw\_checksum\_len, Dwarf\_Small \*\*dw\_checksum, Dwarf\_Error \*dw\_error)

*Return basic .debug\_sup section header data.*

### 9.24.1 Detailed Description

## 9.24.2 Function Documentation

### 9.24.2.1 dwarf\_get\_debug\_sup()

```
DW_API int dwarf_get_debug_sup (
    Dwarf_Debug dw_dbg,
    Dwarf_Half * dw_version,
    Dwarf_Small * dw_is_supplementary,
    char ** dw_filename,
    Dwarf_Unsigned * dw_checksum_len,
    Dwarf_Small ** dw_checksum,
    Dwarf_Error * dw_error )
```

Return basic .debug\_sup section header data.

This returns basic data from the header of a .debug\_sup section. See DWARF5 Section 7.3.6, "DWARF Supplementary Object Files"

Other sections present should be normal DWARF5, so normal libdwarf calls should work. We have no existing examples on hand, so it is hard to know what really works.

If there is no such section it returns DW\_DLV\_NO\_ENTRY.

## 9.25 Fast Access to .debug\_names DWARF5

### Functions

- DW\_API int `dwarf_dnames_header` (`Dwarf_Debug` dw\_dbg, `Dwarf_Off` dw\_starting\_offset, `Dwarf_Dnames_Head` \*dw\_dn, `Dwarf_Off` \*dw\_offset\_of\_next\_table, `Dwarf_Error` \*dw\_error)  
*Open access to a .debug\_names table.*
- DW\_API void `dwarf_dealloc_dnames` (`Dwarf_Dnames_Head` dw\_dn)  
*Frees all the malloc data associated with dw\_dn.*
- DW\_API int `dwarf_dnames_abbrevtable` (`Dwarf_Dnames_Head` dw\_dn, `Dwarf_Unsigned` dw\_index, `Dwarf_Unsigned` \*dw\_abbrev\_offset, `Dwarf_Unsigned` \*dw\_abbrev\_code, `Dwarf_Unsigned` \*dw\_abbrev\_tag, `Dwarf_Unsigned` dw\_array\_size, `Dwarf_Half` \*dw\_idxattr\_array, `Dwarf_Half` \*dw\_form\_array, `Dwarf_Unsigned` \*dw\_idxattr\_count)  
*Access to the abbrevs table content.*
- DW\_API int `dwarf_dnames_sizes` (`Dwarf_Dnames_Head` dw\_dn, `Dwarf_Unsigned` \*dw\_comp\_unit\_count, `Dwarf_Unsigned` \*dw\_local\_type\_unit\_count, `Dwarf_Unsigned` \*dw\_foreign\_type\_unit\_count, `Dwarf_Unsigned` \*dw\_bucket\_count, `Dwarf_Unsigned` \*dw\_name\_count, `Dwarf_Unsigned` \*dw\_abbrev\_table\_size, `Dwarf_Unsigned` \*dw\_entry\_pool\_size, `Dwarf_Unsigned` \*dw\_augmentation\_string\_size, char \*\*dw\_augmentation\_string, `Dwarf_Unsigned` \*dw\_section\_size, `Dwarf_Half` \*dw\_table\_version, `Dwarf_Half` \*dw\_offset\_size, `Dwarf_Error` \*dw\_error)  
*Sizes and counts from the debug names table.*
- DW\_API int `dwarf_dnames_offsets` (`Dwarf_Dnames_Head` dw\_dn, `Dwarf_Unsigned` \*dw\_header\_offset, `Dwarf_Unsigned` \*dw\_cu\_table\_offset, `Dwarf_Unsigned` \*dw\_tu\_local\_offset, `Dwarf_Unsigned` \*dw\_foreign\_tu\_offset, `Dwarf_Unsigned` \*dw\_bucket\_offset, `Dwarf_Unsigned` \*dw\_hashes\_offset, `Dwarf_Unsigned` \*dw\_stringoffsets\_offset, `Dwarf_Unsigned` \*dw\_entryoffsets\_offset, `Dwarf_Unsigned` \*dw\_abbrev\_table\_offset, `Dwarf_Unsigned` \*dw\_entry\_pool\_offset, `Dwarf_Error` \*dw\_error)  
*Offsets from the debug names table.*
- DW\_API int `dwarf_dnames_cu_table` (`Dwarf_Dnames_Head` dw\_dn, const char \*dw\_type, `Dwarf_Unsigned` dw\_index\_number, `Dwarf_Unsigned` \*dw\_offset, `Dwarf_Sig8` \*dw\_sig, `Dwarf_Error` \*dw\_error)  
*Each debug names cu list entry one at a time.*
- DW\_API int `dwarf_dnames_bucket` (`Dwarf_Dnames_Head` dw\_dn, `Dwarf_Unsigned` dw\_bucket\_number, `Dwarf_Unsigned` \*dw\_index, `Dwarf_Unsigned` \*dw\_indexcount, `Dwarf_Error` \*dw\_error)  
*Access to bucket contents.*
- DW\_API int `dwarf_dnames_name` (`Dwarf_Dnames_Head` dw\_dn, `Dwarf_Unsigned` dw\_name\_index, `Dwarf_Unsigned` \*dw\_bucket\_number, `Dwarf_Unsigned` \*dw\_hash\_value, `Dwarf_Unsigned` \*dw\_offset\_to\_debug\_str, char \*\*dw\_ptrtostr, `Dwarf_Unsigned` \*dw\_offset\_in\_entrypool, `Dwarf_Unsigned` \*dw\_abbrev\_number, `Dwarf_Half` \*dw\_abbrev\_tag, `Dwarf_Unsigned` dw\_array\_size, `Dwarf_Half` \*dw\_idxattr\_array, `Dwarf_Half` \*dw\_form\_array, `Dwarf_Unsigned` \*dw\_idxattr\_count, `Dwarf_Error` \*dw\_error)  
*Retrieve a name table entry.*
- DW\_API int `dwarf_dnames_entrypool` (`Dwarf_Dnames_Head` dw\_dn, `Dwarf_Unsigned` dw\_offset\_in\_entrypool, `Dwarf_Unsigned` \*dw\_abbrev\_code, `Dwarf_Half` \*dw\_tag, `Dwarf_Unsigned` \*dw\_value\_count, `Dwarf_Unsigned` \*dw\_index\_of\_abbrev, `Dwarf_Unsigned` \*dw\_offset\_of\_initial\_value, `Dwarf_Error` \*dw\_error)  
*Return a the set of values from an entrypool entry.*
- DW\_API int `dwarf_dnames_entrypool_values` (`Dwarf_Dnames_Head` dw\_dn, `Dwarf_Unsigned` dw\_index\_of\_abbrev, `Dwarf_Unsigned` dw\_offset\_in\_entrypool\_of\_values, `Dwarf_Unsigned` dw\_arrays\_length, `Dwarf_Half` \*dw\_array\_idx\_number, `Dwarf_Half` \*dw\_array\_form, `Dwarf_Unsigned` \*dw\_array\_of\_offsets, `Dwarf_Sig8` \*dw\_array\_of\_signatures, `Dwarf_Bool` \*dw\_single\_cu, `Dwarf_Unsigned` \*dw\_cu\_offset, `Dwarf_Unsigned` \*dw\_offset\_of\_next\_entrypool, `Dwarf_Error` \*dw\_error)  
*Return the value set defined by this entry.*

### 9.25.1 Detailed Description

The section is new in DWARF5 and supersedes `.debug_pubnames` and `.debug_pubtypes` in DWARF2, DWARF3, and DWARF4.

The functions provide a detailed reporting of the content and structure of the table (so one can build one's own search table) but they are not particularly helpful for searching.

A new function (more than one?) would be needed for convenient searching.

### 9.25.2 Function Documentation

#### 9.25.2.1 `dwarf_dealloc_dnames()`

```
DW_API void dwarf_dealloc_dnames (
    Dwarf_Dnames_Head dw_dn )
```

Frees all the malloc data associated with `dw_dn`.

##### Parameters

<code>dw_dn</code>	A <code>Dwarf_Dnames_Head</code> pointer. Callers should zero the pointer passed in as soon as possible after this returns as the pointer is then stale.
--------------------	--

#### 9.25.2.2 `dwarf_dnames_abbrevtable()`

```
DW_API int dwarf_dnames_abbrevtable (
    Dwarf_Dnames_Head dw_dn,
    Dwarf_Unsigned dw_index,
    Dwarf_Unsigned * dw_abbrev_offset,
    Dwarf_Unsigned * dw_abbrev_code,
    Dwarf_Unsigned * dw_abbrev_tag,
    Dwarf_Unsigned dw_array_size,
    Dwarf_Half * dw_idxattr_array,
    Dwarf_Half * dw_form_array,
    Dwarf_Unsigned * dw_idxattr_count )
```

Access to the abbrevs table content.

Of interest mainly to debugging issues with compilers or debuggers.

##### Parameters

<code>dw_dn</code>	A <code>Dwarf_Dnames_Head</code> pointer.
<code>dw_index</code>	An index (starting at zero) into a table constructed of abbrev data. These indexes are derived from abbrev data and are not in the abbrev data itself.
<code>dw_abbrev_offset</code>	Returns the offset of the abbrev table entry for this names table entry.
<code>dw_abbrev_code</code>	Returns the abbrev code for the abbrev at offset <code>dw_abbrev_offset</code> .
<code>dw_abbrev_tag</code>	Returns the tag for the abbrev at offset <code>dw_abbrev_offset</code> .
<code>dw_array_size</code>	The size you allocated in each of the following two arrays.

## Parameters

<i>dw_idxattr_array</i>	Pass in an array you allocated where the function returns and array of index attributes (DW_IDX) for this dw_abbrev_code. The last attribute code in the array is zero.
<i>dw_form_array</i>	Pass in an array you allocated where the function returns and array of forms for this dw_abbrev_code (paralleled to dw_idxattr_array). The last form code in the array is zero.
<i>dw_idxattr_count</i>	Returns the actual idxattribute/form count (including the terminating 0,0 pair. If the array_size passed in is less than this value the array returned is incomplete. Array entries needed. Might be larger than dw_array_size, meaning not all entries could be returned in your arrays.

## Returns

Returns DW\_DLV\_OK on success. If the offset does not refer to a known part of the abbrev table it returns DW\_DLV\_NO\_ENTRY. Never returns DW\_DLV\_ERROR.

## 9.25.2.3 dwarf\_dnames\_bucket()

```
DW_API int dwarf_dnames_bucket (
    Dwarf_Dnames_Head dw_dn,
    Dwarf_Unsigned dw_bucket_number,
    Dwarf_Unsigned * dw_index,
    Dwarf_Unsigned * dw_indexcount,
    Dwarf_Error * dw_error )
```

Access to bucket contents.

## Parameters

<i>dw_dn</i>	The Dwarf_Dnames_Head of interest.
<i>dw_bucket_number</i>	Pass in a bucket number Bucket numbers start at 0.
<i>dw_index</i>	On success returns the index of the appropriate name entry. Name entry indexes start at one, a zero index means the bucket is unused.
<i>dw_indexcount</i>	On success returns the number of name entries in the bucket.
<i>dw_error</i>	On error dw_error is set to point to the error details.

## Returns

The usual value: DW\_DLV\_OK etc. An out of range dw\_index\_number gets a return if DW\_DLV\_NO\_ENTRY

## 9.25.2.4 dwarf\_dnames\_cu\_table()

```
DW_API int dwarf_dnames_cu_table (
    Dwarf_Dnames_Head dw_dn,
    const char * dw_type,
    Dwarf_Unsigned dw_index_number,
    Dwarf_Unsigned * dw_offset,
    Dwarf_Sig8 * dw_sig,
    Dwarf_Error * dw_error )
```

Each debug names cu list entry one at a time.

Indexes to the cu/tu/ tables start at 0.

Some values in `dw_offset` are actually offsets, such as for `DW_IDX_die_offset`. `DW_IDX_compile_unit` and `DW_IDX_type_unit` are indexes into the table specified by `dw_type` and are returned through `dw_offset` field;

#### Parameters

<code>dw_dn</code>	The table of interest.
<code>dw_type</code>	Pass in the type, "cu" or "tu"
<code>dw_index_number</code>	For "cu" index range is 0 through K-1 For "tu" index range is 0 through T+F-1
<code>dw_offset</code>	Zero if it cannot be determined. (check the return value!).
<code>dw_sig</code>	the Dwarf_Sig8 is filled in with a signature if the TU index is T through T+F-1
<code>dw_error</code>	On error <code>dw_error</code> is set to point to the error details.

#### Returns

The usual value: `DW_DLV_OK` etc.

### 9.25.2.5 dwarf\_dnames\_entrypool()

```
DW_API int dwarf_dnames_entrypool (
    Dwarf_Dnames_Head dw_dn,
    Dwarf_Unsigned dw_offset_in_entrypool,
    Dwarf_Unsigned * dw_abbrev_code,
    Dwarf_Half * dw_tag,
    Dwarf_Unsigned * dw_value_count,
    Dwarf_Unsigned * dw_index_of_abbrev,
    Dwarf_Unsigned * dw_offset_of_initial_value,
    Dwarf_Error * dw_error )
```

Return a the set of values from an entrypool entry.

Returns the basic data about an entrypool record and enables correct calling of `dwarf_dnames_entrypool_values` (see below). The two-stage approach makes it simple for callers to prepare for the number of values that will be returned by `dwarf_dnames_entrypool_values()`

#### Parameters

<code>dw_dn</code>	Pass in the debug names table of interest.
<code>dw_offset_in_entrypool</code>	The record offset (in the entry pool table) of the first record of IDX attributes. Starts at zero.
<code>dw_abbrev_code</code>	On success returns the abbrev code of the idx attributes for the pool entry.
<code>dw_tag</code>	On success returns the TAG of the DIE referred to by this entrypool entry.
<code>dw_value_count</code>	On success returns the number of distinct values imply by this entry.
<code>dw_index_of_abbrev</code>	On success returns the index of the abbrev index/form pairs in the abbreviation table.
<code>dw_offset_of_initial_value</code>	On success returns the entry pool offset of the sequence of bytes containing values, such as a CU index or a DIE offset.
<code>dw_error</code>	The usual error detail record

## Returns

DW\_DLV\_OK is returned if the specified name entry exists. DW\_DLV\_NO\_ENTRY is returned if the specified offset is outside the size of the table. DW\_DLV\_ERROR is returned in case of an internal error or corrupt section content.

## 9.25.2.6 dwarf\_dnames\_entrpool\_values()

```
DW_API int dwarf_dnames_entrpool_values (
    Dwarf_Dnames_Head dw_dn,
    Dwarf_Unsigned dw_index_of_abbrev,
    Dwarf_Unsigned dw_offset_in_entrpool_of_values,
    Dwarf_Unsigned dw_arrays_length,
    Dwarf_Half * dw_array_idx_number,
    Dwarf_Half * dw_array_form,
    Dwarf_Unsigned * dw_array_of_offsets,
    Dwarf_Sig8 * dw_array_of_signatures,
    Dwarf_Bool * dw_single_cu,
    Dwarf_Unsigned * dw_cu_offset,
    Dwarf_Unsigned * dw_offset_of_next_entrpool,
    Dwarf_Error * dw_error )
```

Return the value set defined by this entry.

Call here after calling dwarf\_dnames\_entrpool to provide data to call this function correctly.

This retrieves the index attribute values that identify a names table name.

The caller allocates a set of arrays and the function fills them in. If dw\_array\_idx\_number[n] is DW\_IDX\_type\_hash then dw\_array\_of\_signatures[n] contains the hash. For other IDX values dw\_array\_of\_offsets[n] contains the value being returned.

## Parameters

<i>dw_dn</i>	Pass in the debug names table of interest.
<i>dw_index_of_abbrev</i>	Pass in the abbreviation index.
<i>dw_offset_in_entrpool_of_values</i>	Pass in the offset of the values returned by dw_offset_of_initial_value above.
<i>dw_arrays_length</i>	Pass in the array length of each of the following four fields. The dw_value_count returned above is what you need to use.
<i>dw_array_idx_number</i>	Create an array of Dwarf_Half values, dw_arrays_length long, and pass a pointer to the first entry here.
<i>dw_array_form</i>	Create an array of Dwarf_Half values, dw_arrays_length long, and pass a pointer to the first entry here.
<i>dw_array_of_offsets</i>	Create an array of Dwarf_Unsigned values, dw_arrays_length long, and pass a pointer to the first entry here.
<i>dw_array_of_signatures</i>	Create an array of Dwarf_Sig8 structs, dw_arrays_length long, and pass a pointer to the first entry here.
<i>dw_offset_of_next_entrpool</i>	On success returns the offset of the next entrpool. A value here is usable in the next call to dwarf_dnames_entrpool.
<i>dw_single_cu</i>	On success, if it is a single-cu name table there is likely no DW_IDX_compile_unit. So we return TRUE via this flag in such a case.
<i>dw_cu_offset</i>	On success, for a single-cu name table with no DW_IDX_compile_unit this is set to the CU offset from that single CU-table entry.
<i>dw_error</i>	The usual error detail record

### Returns

DW\_DLV\_OK is returned if the specified name entry exists. DW\_DLV\_NO\_ENTRY is returned if the specified offset is outside the size of the table. DW\_DLV\_ERROR is returned in case of an internal error or corrupt section content.

#### 9.25.2.7 dwarf\_dnames\_header()

```
DW_API int dwarf_dnames_header (
    Dwarf_Debug dw_dbg,
    Dwarf_Off dw_starting_offset,
    Dwarf_Dnames_Head * dw_dn,
    Dwarf_Off * dw_offset_of_next_table,
    Dwarf_Error * dw_error )
```

Open access to a .debug\_names table.

### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_starting_offset</i>	Read this section starting at offset zero.
<i>dw_dn</i>	On success returns a pointer to a set of data allowing access to the table.
<i>dw_offset_of_next_table</i>	On success returns Offset just past the end of the the opened table.
<i>dw_error</i>	On error dw_error is set to point to the error details.

### Returns

The usual value: DW\_DLV\_OK etc. If there is no such table or if dw\_starting\_offset is past the end of the section it returns DW\_DLV\_NO\_ENTRY.

#### 9.25.2.8 dwarf\_dnames\_name()

```
DW_API int dwarf_dnames_name (
    Dwarf_Dnames_Head dw_dn,
    Dwarf_Unsigned dw_name_index,
    Dwarf_Unsigned * dw_bucket_number,
    Dwarf_Unsigned * dw_hash_value,
    Dwarf_Unsigned * dw_offset_to_debug_str,
    char ** dw_ptrtostr,
    Dwarf_Unsigned * dw_offset_in_entrypool,
    Dwarf_Unsigned * dw_abbrev_number,
    Dwarf_Half * dw_abbrev_tag,
    Dwarf_Unsigned dw_array_size,
    Dwarf_Half * dw_idxattr_array,
    Dwarf_Half * dw_form_array,
    Dwarf_Unsigned * dw_idxattr_count,
    Dwarf_Error * dw_error )
```

Retrieve a name table entry.

Retrieve the name and other data from a single name table entry.

## Parameters

<i>dw_dn</i>	The table of interest.
<i>dw_name_index</i>	Pass in the desired index, start at one.
<i>dw_bucket_number</i>	On success returns a bucket number, zero if no buckets present.
<i>dw_hash_value</i>	The hash value, all zeros if no hashes present
<i>dw_offset_to_debug_str</i>	The offset to the .debug_str section string.
<i>dw_ptrtostr</i>	if dw_ptrtostr non-null returns a pointer to the applicable string here.
<i>dw_offset_in_entrypool</i>	Returns the offset in the entrypool
<i>dw_abbrev_number</i>	Returned from entrypool.
<i>dw_abbrev_tag</i>	Returned from entrypool abbrev data.
<i>dw_array_size</i>	Size of array you provide to hold DW_IDX index attribute and form numbers. Possibly 10 suffices for practical purposes.
<i>dw_idxattr_array</i>	Array space you provide, for idx attribute numbers (function will initialize it). The final entry in the array will be 0.
<i>dw_form_array</i>	Array you provide, for form numbers (function will initialize it). The final entry in the array will be 0.
<i>dw_idxattr_count</i>	Array entries needed. Might be larger than dw_array_size, meaning not all entries could be returned in your array.
<i>dw_error</i>	On error dw_error is set to point to the error details.

## Returns

The usual value: DW\_DLV\_OK etc. If the index passed in is outside the valid range returns DW\_DLV\_NO\_ENTRY.

## 9.25.2.9 dwarf\_dnames\_offsets()

```
DW_API int dwarf_dnames_offsets (
    Dwarf_Dnames_Head dw_dn,
    Dwarf_Unsigned * dw_header_offset,
    Dwarf_Unsigned * dw_cu_table_offset,
    Dwarf_Unsigned * dw_tu_local_offset,
    Dwarf_Unsigned * dw_foreign_tu_offset,
    Dwarf_Unsigned * dw_bucket_offset,
    Dwarf_Unsigned * dw_hashes_offset,
    Dwarf_Unsigned * dw_stringoffsets_offset,
    Dwarf_Unsigned * dw_entryoffsets_offset,
    Dwarf_Unsigned * dw_abbrev_table_offset,
    Dwarf_Unsigned * dw_entry_pool_offset,
    Dwarf_Error * dw_error )
```

Offsets from the debug names table.

We do not describe these returned values, which refer to the .debug\_names section.

The header offset is a section offset. The rest are offsets from the header.

See DWARF5 section 6.1.1 "Lookup By Name"

### 9.25.2.10 dwarf\_dnames\_sizes()

```
DW_API int dwarf_dnames_sizes (
    Dwarf_Dnames_Head dw_dn,
    Dwarf_Unsigned * dw_comp_unit_count,
    Dwarf_Unsigned * dw_local_type_unit_count,
    Dwarf_Unsigned * dw_foreign_type_unit_count,
    Dwarf_Unsigned * dw_bucket_count,
    Dwarf_Unsigned * dw_name_count,
    Dwarf_Unsigned * dw_abbrev_table_size,
    Dwarf_Unsigned * dw_entry_pool_size,
    Dwarf_Unsigned * dw_augmentation_string_size,
    char ** dw_augmentation_string,
    Dwarf_Unsigned * dw_section_size,
    Dwarf_Half * dw_table_version,
    Dwarf_Half * dw_offset_size,
    Dwarf_Error * dw_error )
```

Sizes and counts from the debug names table.

We do not describe these returned values. Other than for `dw_dn` and `dw_error` passing pointers you do not care about as NULL is fine. Of course no value can be returned through those passed as NULL.

Any program referencing a names table will need at least a few of these values.

See DWARF5 section 6.1.1 "Lookup By Name" particularly the graph page 139. `dw_comp_unit_count` is K(k), `dw_local_type_unit_count` is T(t), and `dw_foreign_type_unit_count` is F(f).

## 9.26 Fast Access to a CU given a code address

### Functions

- DW\_API int `dwarf_get_aranges` (Dwarf\_Debug dw\_dbg, Dwarf\_Arange \*\*dw\_aranges, Dwarf\_Signed \*dw\_↵  
\_arange\_count, Dwarf\_Error \*dw\_error)  
*Get access to CUs given code addresses.*
- DW\_API int `dwarf_get_arange` (Dwarf\_Arange \*dw\_aranges, Dwarf\_Unsigned dw\_arange\_count,  
Dwarf\_Addr dw\_address, Dwarf\_Arange \*dw\_returned\_arange, Dwarf\_Error \*dw\_error)  
*Find a range given a code address.*
- DW\_API int `dwarf_get_cu_die_offset` (Dwarf\_Arange dw\_arange, Dwarf\_Off \*dw\_return\_offset, Dwarf\_Error  
\*dw\_error)  
*Given an arange return its CU DIE offset.*
- DW\_API int `dwarf_get_arange_cu_header_offset` (Dwarf\_Arange dw\_arange, Dwarf\_Off \*dw\_return\_cu\_↵  
header\_offset, Dwarf\_Error \*dw\_error)  
*Given an arange return its CU header offset.*
- DW\_API int `dwarf_get_arange_info_b` (Dwarf\_Arange dw\_arange, Dwarf\_Unsigned \*dw\_segment,  
Dwarf\_Unsigned \*dw\_segment\_entry\_size, Dwarf\_Addr \*dw\_start, Dwarf\_Unsigned \*dw\_length, Dwarf\_Off  
\*dw\_cu\_die\_offset, Dwarf\_Error \*dw\_error)  
*Get the data in an arange entry.*

## 9.26.1 Detailed Description

## 9.26.2 Function Documentation

### 9.26.2.1 dwarf\_get\_arange()

```
DW_API int dwarf_get_arange (
    Dwarf_Arange * dw_aranges,
    Dwarf_Unsigned dw_arange_count,
    Dwarf_Addr dw_address,
    Dwarf_Arange * dw_returned_arange,
    Dwarf_Error * dw_error )
```

Find a range given a code address.

#### Parameters

<i>dw_aranges</i>	Pass in a pointer to the first entry in the aranges array of pointers.
<i>dw_arange_count</i>	Pass in the <i>dw_arange_count</i> , the count for the array.
<i>dw_address</i>	Pass in the code address of interest.
<i>dw_returned_arange</i>	On success, returns the particular arange that holds that address.
<i>dw_error</i>	On error <i>dw_error</i> is set to point to the error details.

#### Returns

The usual value: DW\_DLV\_OK etc. Returns DW\_DLV\_NO\_ENTRY if there is no such code address present in the section.

### 9.26.2.2 dwarf\_get\_arange\_cu\_header\_offset()

```
DW_API int dwarf_get_arange_cu_header_offset (
    Dwarf_Arange dw_arange,
    Dwarf_Off * dw_return_cu_header_offset,
    Dwarf_Error * dw_error )
```

Given an arange return its CU header offset.

#### Parameters

<i>dw_arange</i>	The specific arange of interest.
<i>dw_return_cu_header_offset</i>	The CU header offset (in <i>.debug_info</i> ) applicable to this arange.
<i>dw_error</i>	On error <i>dw_error</i> is set to point to the error details.

#### Returns

The usual value: DW\_DLV\_OK etc.

### 9.26.2.3 dwarf\_get\_arange\_info\_b()

```
DW_API int dwarf_get_arange_info_b (
    Dwarf_Arange dw_arange,
    Dwarf_Unsigned * dw_segment,
    Dwarf_Unsigned * dw_segment_entry_size,
    Dwarf_Addr * dw_start,
    Dwarf_Unsigned * dw_length,
    Dwarf_Off * dw_cu_die_offset,
    Dwarf_Error * dw_error )
```

Get the data in an arange entry.

#### Parameters

<i>dw_arange</i>	The specific arange of interest.
<i>dw_segment</i>	On success and if <i>segment_entry_size</i> is non-zero this returns the segment number from the arange.
<i>dw_segment_entry_size</i>	On success returns the segment entry size from the arange.
<i>dw_start</i>	On success returns the low address this arange refers to.
<i>dw_length</i>	On success returns the length, in bytes of the code area this arange refers to.
<i>dw_cu_die_offset</i>	On success returns the .debug_info section offset the arange refers to.
<i>dw_error</i>	On error <i>dw_error</i> is set to point to the error details.

#### Returns

The usual value: DW\_DLV\_OK etc.

### 9.26.2.4 dwarf\_get\_aranges()

```
DW_API int dwarf_get_aranges (
    Dwarf_Debug dw_dbg,
    Dwarf_Arange ** dw_aranges,
    Dwarf_Signed * dw_arange_count,
    Dwarf_Error * dw_error )
```

Get access to CUs given code addresses.

This intended as a fast-access to tie code addresses to CU dies. The data is in the .debug\_aranges section. which may appear in DWARF2,3,4, or DWARF5.

#### See also

[Reading an aranges section](#)

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_aranges</i>	On success returns a pointer to an array of Dwarf_Arange pointers.
<i>dw_arange_count</i>	On success returns a count of the length of the array.
<i>dw_error</i>	On error <i>dw_error</i> is set to point to the error details.

**Returns**

The usual value: DW\_DLV\_OK etc. Returns DW\_DLV\_NO\_ENTRY if there is no such section.

**9.26.2.5 dwarf\_get\_cu\_die\_offset()**

```
DW_API int dwarf_get_cu_die_offset (
    Dwarf_Arange dw_arange,
    Dwarf_Off * dw_return_offset,
    Dwarf_Error * dw_error )
```

Given an arange return its CU DIE offset.

**Parameters**

<i>dw_arange</i>	The specific arange of interest.
<i>dw_return_offset</i>	The CU DIE offset (in .debug_info) applicable to this arange..
<i>dw_error</i>	On error dw_error is set to point to the error details.

**Returns**

The usual value: DW\_DLV\_OK etc.

**9.27 Fast Access to .debug\_pubnames and more.****Macros**

- #define **DW\_GL\_GLOBALS** 0 /\* .debug\_pubnames and .debug\_names \*/
- #define **DW\_GL\_PUBTYPES** 1 /\* .debug\_pubtypes \*/
- #define **DW\_GL\_FUNCS** 2 /\* .debug\_funcnames \*/

- #define **DW\_GL\_WEAKS** 5 /\* .debug\_weaknames \*/

**Functions**

- DW\_API int **dwarf\_get\_globals** (Dwarf\_Debug dw\_dbg, Dwarf\_Global \*\*dw\_globals, Dwarf\_Signed \*dw\_↔ number\_of\_globals, Dwarf\_Error \*dw\_error)  
*Global name space operations, .debug\_pubnames access.*
- DW\_API int **dwarf\_get\_pubtypes** (Dwarf\_Debug dw\_dbg, Dwarf\_Global \*\*dw\_pubtypes, Dwarf\_Signed \*dw\_number\_of\_pubtypes, Dwarf\_Error \*dw\_error)  
*Global debug types access.*
- DW\_API int **dwarf\_globals\_by\_type** (Dwarf\_Debug dw\_dbg, int dw\_requested\_section, Dwarf\_Global \*\*dw\_↔ \_contents, Dwarf\_Signed \*dw\_count, Dwarf\_Error \*dw\_error)  
*Allocate Any Fast Access DWARF2-DWARF4.*
- DW\_API void **dwarf\_globals\_dealloc** (Dwarf\_Debug dw\_dbg, Dwarf\_Global \*dw\_global\_like, Dwarf\_Signed dw\_count)  
*Dealloc the Dwarf\_Global data.*
- DW\_API int **dwarf\_globname** (Dwarf\_Global dw\_global, char \*\*dw\_returned\_name, Dwarf\_Error \*dw\_error)

*Return the name of a global-like data item.*

- DW\_API int [dwarf\\_global\\_die\\_offset](#) (Dwarf\_Global dw\_global, Dwarf\_Off \*dw\_die\_offset, Dwarf\_Error \*dw\_error)

*Return the DIE offset of a global data item.*

- DW\_API int [dwarf\\_global\\_cu\\_offset](#) (Dwarf\_Global dw\_global, Dwarf\_Off \*dw\_cu\_header\_offset, Dwarf\_Error \*dw\_error)

*Return the CU header data of a global data item.*

- DW\_API int [dwarf\\_global\\_name\\_offsets](#) (Dwarf\_Global dw\_global, char \*\*dw\_returned\_name, Dwarf\_Off \*dw\_die\_offset, Dwarf\_Off \*dw\_cu\_die\_offset, Dwarf\_Error \*dw\_error)

*Return the name and offsets of a global entry.*

- DW\_API Dwarf\_Half [dwarf\\_global\\_tag\\_number](#) (Dwarf\_Global dw\_global)

*Return the DW\_TAG number of a global entry.*

- DW\_API int [dwarf\\_get\\_globals\\_header](#) (Dwarf\_Global dw\_global, int \*dw\_category, Dwarf\_Off \*dw\_offset↵\_pub\_header, Dwarf\_Unsigned \*dw\_length\_size, Dwarf\_Unsigned \*dw\_length\_pub, Dwarf\_Unsigned \*dw↵\_version, Dwarf\_Unsigned \*dw\_header\_info\_offset, Dwarf\_Unsigned \*dw\_info\_length, Dwarf\_Error \*dw↵error)

*For more complete globals printing.*

- DW\_API int [dwarf\\_return\\_empty\\_pubnames](#) (Dwarf\_Debug dw\_dbg, int dw\_flag)

*A flag for dwarfdump on pubnames, pubtypes etc.*

## 9.27.1 Detailed Description

### Pubnames and Pubtypes overview

These functions each read one of a set of sections designed for fast access by name, but they are not always emitted as they each have somewhat limited and inflexible capabilities. So you may not see many of these.

All have the same set of functions with a name reflecting the specific object section involved. Only the first, of type Dwarf\_Global, is documented here in full detail as the others do the same jobs just each for their applicable object section..

## 9.27.2 Function Documentation

### 9.27.2.1 dwarf\_get\_globals()

```
DW_API int dwarf_get_globals (
    Dwarf_Debug dw_dbg,
    Dwarf_Global ** dw_globals,
    Dwarf_Signed * dw_number_of_globals,
    Dwarf_Error * dw_error )
```

Global name space operations, .debug\_pubnames access.

This accesses .debug\_pubnames and .debug\_names sections. Section .debug\_pubnames is defined in DWARF2, DWARF3, and DWARF4. Section .debug\_names is defined in DWARF5 and contains lots of information, but only the part of the wealth of information that this interface allows can be retrieved here. See [dwarf\\_dnames\\_header\(\)](#) for access to all. debug\_names data.

The code here, as of 0.4.3, September 3 2022, returns data from either section.

See also

[Using dwarf\\_get\\_globals\(\)](#)

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_globals</i>	On success returns an array of pointers to opaque structs..
<i>dw_number_of_globals</i>	On success returns the number of entries in the array.
<i>dw_error</i>	On error dw_error is set to point to the error details.

## Returns

The usual value: DW\_DLV\_OK etc. Returns DW\_DLV\_NO\_ENTRY if the section is not present.

## 9.27.2.2 dwarf\_get\_globals\_header()

```
DW_API int dwarf_get_globals_header (
    Dwarf_Global dw_global,
    int * dw_category,
    Dwarf_Off * dw_offset_pub_header,
    Dwarf_Unsigned * dw_length_size,
    Dwarf_Unsigned * dw_length_pub,
    Dwarf_Unsigned * dw_version,
    Dwarf_Unsigned * dw_header_info_offset,
    Dwarf_Unsigned * dw_info_length,
    Dwarf_Error * dw_error )
```

For more complete globals printing.

For each CU represented in .debug\_pubnames, etc, there is a .debug\_pubnames header. For any given Dwarf\_Global this returns the content of the applicable header. This does not include header information from any .debug\_names headers.

The function declaration changed at version 0.6.0.

## 9.27.2.3 dwarf\_get\_pubtypes()

```
DW_API int dwarf_get_pubtypes (
    Dwarf_Debug dw_dbg,
    Dwarf_Global ** dw_pubtypes,
    Dwarf_Signed * dw_number_of_pubtypes,
    Dwarf_Error * dw_error )
```

Global debug\_types access.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_pubtypes</i>	On success returns an array of pointers to opaque structs..
<i>dw_number_of_pubtypes</i>	On success returns the number of entries in the array.
<i>dw_error</i>	On error dw_error is set to point to the error details.

**Returns**

The usual value: DW\_DLV\_OK etc. Returns DW\_DLV\_NO\_ENTRY if the section is not present.

Same function name as 0.5.0 and earlier, but the data type changes to Dwarf\_Global

[dwarf\\_get\\_pubtypes\(\)](#) is an alternate name for `dwarf_globals_by_type(...,DW_GL_PUBTYPES,...)`.

**9.27.2.4 dwarf\_global\_cu\_offset()**

```
DW_API int dwarf_global_cu_offset (
    Dwarf_Global dw_global,
    Dwarf_Off * dw_cu_header_offset,
    Dwarf_Error * dw_error )
```

Return the CU header data of a global data item.

A CU header offset is rarely useful.

**Parameters**

<i>dw_global</i>	The Dwarf_Global of interest.
<i>dw_cu_header_offset</i>	On success a the section-global offset of a CU header is returned.
<i>dw_error</i>	On error dw_error is set to point to the error details.

**Returns**

The usual value: DW\_DLV\_OK etc.

**9.27.2.5 dwarf\_global\_die\_offset()**

```
DW_API int dwarf_global_die_offset (
    Dwarf_Global dw_global,
    Dwarf_Off * dw_die_offset,
    Dwarf_Error * dw_error )
```

Return the DIE offset of a global data item.

**Parameters**

<i>dw_global</i>	The Dwarf_Global of interest.
<i>dw_die_offset</i>	On success a the section-global DIE offset of a data item is returned.
<i>dw_error</i>	On error dw_error is set to point to the error details.

**Returns**

The usual value: DW\_DLV\_OK etc.

### 9.27.2.6 dwarf\_global\_name\_offsets()

```
DW_API int dwarf_global_name_offsets (
    Dwarf_Global dw_global,
    char ** dw_returned_name,
    Dwarf_Off * dw_die_offset,
    Dwarf_Off * dw_cu_die_offset,
    Dwarf_Error * dw_error )
```

Return the name and offsets of a global entry.

#### Parameters

<i>dw_global</i>	The Dwarf_Global of interest.
<i>dw_returned_name</i>	On success a pointer to the name (a null-terminated string) is returned.
<i>dw_die_offset</i>	On success a the section-global DIE offset of the global with the name.
<i>dw_cu_die_offset</i>	On success a the section-global offset of the relevant CU DIE is returned.
<i>dw_error</i>	On error dw_error is set to point to the error details.

#### Returns

The usual value: DW\_DLV\_OK etc.

### 9.27.2.7 dwarf\_global\_tag\_number()

```
DW_API Dwarf_Half dwarf_global_tag_number (
    Dwarf_Global dw_global )
```

Return the DW\_TAG number of a global entry.

#### Parameters

<i>dw_global</i>	The Dwarf_Global of interest.
------------------	-------------------------------

#### Returns

If the Dwarf\_Global refers to a global from the .debug\_names section the return value is the DW\_TAG for the DIE in the global entry, for example DW\_TAG\_subprogram. In case of error or if the section for this global was not .debug\_names zero is returned.

### 9.27.2.8 dwarf\_globals\_by\_type()

```
DW_API int dwarf_globals_by_type (
    Dwarf_Debug dw_dbg,
    int dw_requested_section,
    Dwarf_Global ** dw_contents,
    Dwarf_Signed * dw_count,
    Dwarf_Error * dw_error )
```

Allocate Any Fast Access DWARF2-DWARF4.

This interface new in 0.6.0. Simplifies access by replace dwarf\_get\_pubtypes, dwarf\_get\_funcs, dwarf\_get\_types, dwarfget\_vars, and dwarf\_get\_weakes with a single set of types.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_requested_section</i>	Pass in one of the values DW_GL_GLOBALS through DW_GL_WEAKS to select the section to extract data from.
<i>dw_contents</i>	On success returns an array of pointers to opaque structs.
<i>dw_count</i>	On success returns the number of entries in the array.
<i>dw_error</i>	On error dw_error is set to point to the error details.

## Returns

The usual value: DW\_DLV\_OK etc. Returns DW\_DLV\_NO\_ENTRY if the section is not present.

**9.27.2.9 dwarf\_globals\_dealloc()**

```
DW_API void dwarf_globals_dealloc (
    Dwarf_Debug dw_dbg,
    Dwarf_Global * dw_global_like,
    Dwarf_Signed dw_count )
```

Dealloc the Dwarf\_Global data.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_global_like</i>	The array of globals/types/etc data to dealloc (free).
<i>dw_count</i>	The number of entries in the array.

**9.27.2.10 dwarf\_globname()**

```
DW_API int dwarf_globname (
    Dwarf_Global dw_global,
    char ** dw_returned_name,
    Dwarf_Error * dw_error )
```

Return the name of a global-like data item.

## Parameters

<i>dw_global</i>	The Dwarf_Global of interest.
<i>dw_returned_name</i>	On success a pointer to the name (a null-terminated string) is returned.
<i>dw_error</i>	On error dw_error is set to point to the error details.

## Returns

The usual value: DW\_DLV\_OK etc.

### 9.27.2.11 dwarf\_return\_empty\_pubnames()

```
DW_API int dwarf_return_empty_pubnames (
    Dwarf_Debug dw_dbg,
    int dw_flag )
```

A flag for dwarfdump on pubnames, pubtypes etc.

Sets a flag in the dbg. Always returns DW\_DLV\_OK. Applies to all the sections of this kind: pubnames, pubtypes, funcs, typenames, vars, weaks. Ensures empty content (meaning no offset/name tuples, but with a header) for a CU shows up rather than being suppressed.

Primarily useful if one wants to note any pointless header data in the section.

#### Pubnames and Pubtypes overview

##### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_flag</i>	Must be the value one.

##### Returns

Returns DW\_DLV\_OK. Always.

## 9.28 Fast Access to GNU .debug\_gnu\_pubnames

### Functions

- DW\_API int [dwarf\\_get\\_gnu\\_index\\_head](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Bool dw\_which\_section, Dwarf\_Gnu\_Index\_Head \*dw\_head, Dwarf\_Unsigned \*dw\_index\_block\_count\_out, Dwarf\_Error \*dw\_error)  
*Access to .debug\_gnu\_pubnames or .debug\_gnu\_pubtypes.*
- DW\_API void [dwarf\\_gnu\\_index\\_dealloc](#) (Dwarf\_Gnu\_Index\_Head dw\_head)  
*Free resources of .debug\_gnu\_pubnames .debug\_gnu\_pubtypes.*
- DW\_API int [dwarf\\_get\\_gnu\\_index\\_block](#) (Dwarf\_Gnu\_Index\_Head dw\_head, Dwarf\_Unsigned dw\_number, Dwarf\_Unsigned \*dw\_block\_length, Dwarf\_Half \*dw\_version, Dwarf\_Unsigned \*dw\_offset\_into\_debug\_info, Dwarf\_Unsigned \*dw\_size\_of\_debug\_info\_area, Dwarf\_Unsigned \*dw\_count\_of\_index\_entries, Dwarf\_Error \*dw\_error)  
*Access a particular block.*
- DW\_API int [dwarf\\_get\\_gnu\\_index\\_block\\_entry](#) (Dwarf\_Gnu\_Index\_Head dw\_head, Dwarf\_Unsigned dw\_blocknumber, Dwarf\_Unsigned dw\_entrynumber, Dwarf\_Unsigned \*dw\_offset\_in\_debug\_info, const char \*\*dw\_name\_string, unsigned char \*dw\_flagbyte, unsigned char \*dw\_staticorglobal, unsigned char \*dw\_typeofentry, Dwarf\_Error \*dw\_error)  
*Access a particular entry of a block.*

### 9.28.1 Detailed Description

Section .debug\_gnu\_pubnames or .debug\_gnu\_pubtypes.

This is a section created for and used by the GNU gdb debugger to access DWARF information.

Not part of standard DWARF.

## 9.28.2 Function Documentation

### 9.28.2.1 dwarf\_get\_gnu\_index\_block()

```
DW_API int dwarf_get_gnu_index_block (
    Dwarf_Gnu_Index_Head dw_head,
    Dwarf_Unsigned dw_number,
    Dwarf_Unsigned * dw_block_length,
    Dwarf_Half * dw_version,
    Dwarf_Unsigned * dw_offset_into_debug_info,
    Dwarf_Unsigned * dw_size_of_debug_info_area,
    Dwarf_Unsigned * dw_count_of_index_entries,
    Dwarf_Error * dw_error )
```

Access a particular block.

#### Parameters

<i>dw_head</i>	Pass in the Dwarf_Gnu_Index_head interest.
<i>dw_number</i>	Pass in the block number of the block of interest. 0 through dw_index_block_count_out-1.
<i>dw_block_length</i>	On success set to the length of the data in this block, in bytes.
<i>dw_version</i>	On success set to the version number of the block.
<i>dw_offset_into_debug_info</i>	On success set to the offset, in .debug_info, of the data for this block. The returned offset may be outside the bounds of the actual .debug_info section, such a possibility does not cause the function to return DW_DLV_ERROR.
<i>dw_size_of_debug_info_area</i>	On success set to the size in bytes, in .debug_info, of the area this block refers to. The returned dw_dw_size_of_debug_info_area plus dw_offset_into_debug_info may be outside the bounds of the actual .debug_info section, such a possibility does not cause the function to return DW_DLV_ERROR. Use <a href="#">dwarf_get_section_max_offsets_d()</a> to learn the size of .debug_info and optionally other sections as well.
<i>dw_count_of_index_entries</i>	On success set to the count of index entries in this particular block number.
<i>dw_error</i>	On error dw_error is set to point to the error details.

#### Returns

Returns DW\_DLV\_OK, DW\_DLV\_NO\_ENTRY (if the section does not exist or is empty), or, in case of an error reading the section, DW\_DLV\_ERROR.

### 9.28.2.2 dwarf\_get\_gnu\_index\_block\_entry()

```
DW_API int dwarf_get_gnu_index_block_entry (
    Dwarf_Gnu_Index_Head dw_head,
    Dwarf_Unsigned dw_blocknumber,
    Dwarf_Unsigned dw_entrynumber,
    Dwarf_Unsigned * dw_offset_in_debug_info,
    const char ** dw_name_string,
    unsigned char * dw_flagbyte,
    unsigned char * dw_staticorglobal,
    unsigned char * dw_typeofentry,
    Dwarf_Error * dw_error )
```

Access a particular entry of a block.

Access to a single entry in a block.

## Parameters

<i>dw_head</i>	Pass in the Dwarf_Gnu_Index_head interest.
<i>dw_blocknumber</i>	Pass in the block number of the block of interest. 0 through dw_index_block_count_out-1.
<i>dw_entrynumber</i>	Pass in the entry number of the entry of interest. 0 through dw_count_of_index_entries-1.
<i>dw_offset_in_debug_info</i>	On success set to the offset in .debug_info relevant to this entry.
<i>dw_name_string</i>	On success set to the size in bytes, in .debug_info, of the area this block refersto.
<i>dw_flagbyte</i>	On success set to the entry flag byte content.
<i>dw_staticorglobal</i>	On success set to the entry static/global letter.
<i>dw_typeofentry</i>	On success set to the type of entry.
<i>dw_error</i>	On error dw_error is set to point to the error details.

## Returns

Returns DW\_DLV\_OK, DW\_DLV\_NO\_ENTRY (if the section does not exist or is empty), or, in case of an error reading the section, DW\_DLV\_ERROR.

## 9.28.2.3 dwarf\_get\_gnu\_index\_head()

```
DW_API int dwarf_get_gnu_index_head (
    Dwarf_Debug dw_dbg,
    Dwarf_Bool dw_which_section,
    Dwarf_Gnu_Index_Head * dw_head,
    Dwarf_Unsigned * dw_index_block_count_out,
    Dwarf_Error * dw_error )
```

Access to .debug\_gnu\_pubnames or .debug\_gnu\_pubtypes.

Call this to get access.

## Parameters

<i>dw_dbg</i>	Pass in the Dwarf_Debug of interest.
<i>dw_which_section</i>	Pass in TRUE to access .debug_gnu_pubnames. Pass in FALSE to access .debug_gnu_typednames.
<i>dw_head</i>	On success, set to a pointer to a head record allowing access to all the content of the section.
<i>dw_index_block_count_out</i>	On success, set to a count of the number of blocks of data available.
<i>dw_error</i>	

## Returns

Returns DW\_DLV\_OK, DW\_DLV\_NO\_ENTRY (if the section does not exist or is empty), or, in case of an error reading the section, DW\_DLV\_ERROR.

## 9.28.2.4 dwarf\_gnu\_index\_dealloc()

```
DW_API void dwarf_gnu_index_dealloc (
    Dwarf_Gnu_Index_Head dw_head )
```

Free resources of `.debug_gnu_pubnames` `.debug_gnu_pubtypes`.

Call this to deallocate all memory used by `dw_head`.

#### Parameters

<code>dw_head</code>	Pass in the <code>Dwarf_Gnu_Index_head</code> whose data is to be deallocated.
----------------------	--

## 9.29 Fast Access to Gdb Index

### Functions

- DW\_API int `dwarf_gdbindex_header` (`Dwarf_Debug` dw\_dbg, `Dwarf_Gdbindex` \*dw\_gdbindexptr, `Dwarf_Unsigned` \*dw\_version, `Dwarf_Unsigned` \*dw\_cu\_list\_offset, `Dwarf_Unsigned` \*dw\_types\_↵  
cu\_list\_offset, `Dwarf_Unsigned` \*dw\_address\_area\_offset, `Dwarf_Unsigned` \*dw\_symbol\_table\_offset, `Dwarf_Unsigned` \*dw\_constant\_pool\_offset, `Dwarf_Unsigned` \*dw\_section\_size, const char \*\*dw\_section\_↵  
\_name, `Dwarf_Error` \*dw\_error)  
*Open access to the .gdb\_index section.*
- DW\_API void `dwarf_dealloc_gdbindex` (`Dwarf_Gdbindex` dw\_gdbindexptr)  
*Free (dealloc) all allocated Dwarf\_Gdbindex memory It should named dwarf\_dealloc\_gdbindex.*
- DW\_API int `dwarf_gdbindex_culist_array` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` \*dw\_list\_↵  
length, `Dwarf_Error` \*dw\_error)  
*Return the culist array length.*
- DW\_API int `dwarf_gdbindex_culist_entry` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` dw\_↵  
entryindex, `Dwarf_Unsigned` \*dw\_cu\_offset, `Dwarf_Unsigned` \*dw\_cu\_length, `Dwarf_Error` \*dw\_error)  
*For a CU entry in the list return the offset and length.*
- DW\_API int `dwarf_gdbindex_types_culist_array` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` \*dw\_↵  
types\_list\_length, `Dwarf_Error` \*dw\_error)  
*Return the types culist array length.*
- DW\_API int `dwarf_gdbindex_types_culist_entry` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` dw\_↵  
types\_entryindex, `Dwarf_Unsigned` \*dw\_cu\_offset, `Dwarf_Unsigned` \*dw\_tu\_offset, `Dwarf_Unsigned` \*dw\_↵  
\_type\_signature, `Dwarf_Error` \*dw\_error)  
*For a types CU entry in the list returns the offset and length.*
- DW\_API int `dwarf_gdbindex_addressarea` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` \*dw\_↵  
addressarea\_list\_length, `Dwarf_Error` \*dw\_error)  
*Get access to gdbindex address area.*
- DW\_API int `dwarf_gdbindex_addressarea_entry` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` dw\_↵  
\_entryindex, `Dwarf_Unsigned` \*dw\_low\_address, `Dwarf_Unsigned` \*dw\_high\_address, `Dwarf_Unsigned`  
\*dw\_cu\_index, `Dwarf_Error` \*dw\_error)  
*Get an address area value.*
- DW\_API int `dwarf_gdbindex_symboltable_array` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` \*dw\_↵  
syntab\_list\_length, `Dwarf_Error` \*dw\_error)  
*Get access to the symboltable array.*
- DW\_API int `dwarf_gdbindex_symboltable_entry` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` dw\_↵  
entryindex, `Dwarf_Unsigned` \*dw\_string\_offset, `Dwarf_Unsigned` \*dw\_cu\_vector\_offset, `Dwarf_Error` \*dw\_↵  
\_error)  
*Access individual syntab entry.*
- DW\_API int `dwarf_gdbindex_cuvector_length` (`Dwarf_Gdbindex` dw\_gdbindexptr, `Dwarf_Unsigned` dw\_↵  
cuvector\_offset, `Dwarf_Unsigned` \*dw\_innercount, `Dwarf_Error` \*dw\_error)  
*Get access to a cuvector.*

- DW\_API int [dwarf\\_gdbindex\\_cuvector\\_inner\\_attributes](#) (Dwarf\_Gdbindex dw\_gdbindexptr, Dwarf\_Unsigned dw\_cuvector\_offset\_in, Dwarf\_Unsigned dw\_innerindex, Dwarf\_Unsigned \*dw\_field\_value, Dwarf\_Error \*dw\_error)

*Get access to a cuvector.*

- DW\_API int [dwarf\\_gdbindex\\_cuvector\\_instance\\_expand\\_value](#) (Dwarf\_Gdbindex dw\_gdbindexptr, Dwarf\_Unsigned dw\_field\_value, Dwarf\_Unsigned \*dw\_cu\_index, Dwarf\_Unsigned \*dw\_symbol\_kind, Dwarf\_Unsigned \*dw\_is\_static, Dwarf\_Error \*dw\_error)

*Expand the bit fields in a cuvector entry.*

- DW\_API int [dwarf\\_gdbindex\\_string\\_by\\_offset](#) (Dwarf\_Gdbindex dw\_gdbindexptr, Dwarf\_Unsigned dw\_stringoffset, const char \*\*dw\_string\_ptr, Dwarf\_Error \*dw\_error)

*Retrieve a symbol name from the index data.*

## 9.29.1 Detailed Description

Section .gdb\_index

This is a section created for and used by the GNU gdb debugger to access DWARF information.

Not part of standard DWARF.

See also

<https://sourceware.org/gdb/onlinedocs/gdb/Index-Section-Format.html#Index-Section-Format>

Version 8 built by gdb, so type entries are ok as is. Version 7 built by the 'gold' linker and type index entries for a CU must be derived otherwise, the type index is not correct... Earlier versions cannot be read correctly by the functions here.

The functions here make it possible to print the section content in detail, there is no search function here.

## 9.29.2 Function Documentation

### 9.29.2.1 dwarf\_dealloc\_gdbindex()

```
DW_API void dwarf_dealloc_gdbindex (
    Dwarf_Gdbindex dw_gdbindexptr )
```

Free (dealloc) all allocated Dwarf\_Gdbindex memory It should named dwarf\_dealloc\_gdbindex.

Parameters

<i>dw_gdbindexptr</i>	Pass in a valid dw_gdbindexptr and on return assign zero to dw_gdbindexptr as it is stale.
-----------------------	--

### 9.29.2.2 dwarf\_gdbindex\_addressarea()

```
DW_API int dwarf_gdbindex_addressarea (
    Dwarf_Gdbindex dw_gdbindexptr,
```

```
Dwarf_Unsigned * dw_addressarea_list_length,
Dwarf_Error * dw_error )
```

Get access to gdbindex address area.

See also

[Reading gdbindex addressarea](#)

#### Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_addressarea_list_length</i>	On success returns the number of entries in the addressarea.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.29.2.3 dwarf\_gdbindex\_addressarea\_entry()

```
DW_API int dwarf_gdbindex_addressarea_entry (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned dw_entryindex,
    Dwarf_Unsigned * dw_low_address,
    Dwarf_Unsigned * dw_high_address,
    Dwarf_Unsigned * dw_cu_index,
    Dwarf_Error * dw_error )
```

Get an address area value.

#### Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_entryindex</i>	Pass in an index, 0 through dw_addressarea_list_length-1. addressarea.
<i>dw_low_address</i>	On success returns the low address for the entry.
<i>dw_high_address</i>	On success returns the high address for the entry.
<i>dw_cu_index</i>	On success returns the index to the cu for the entry.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.29.2.4 dwarf\_gdbindex\_culist\_array()

```
DW_API int dwarf_gdbindex_culist_array (
    Dwarf_Gdbindex dw_gdbindexptr,
```

```
Dwarf_Unsigned * dw_list_length,
Dwarf_Error * dw_error )
```

Return the culist array length.

#### Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_list_length</i>	On success returns the array length of the cu list.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.29.2.5 dwarf\_gdbindex\_culist\_entry()

```
DW_API int dwarf_gdbindex_culist_entry (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned dw_entryindex,
    Dwarf_Unsigned * dw_cu_offset,
    Dwarf_Unsigned * dw_cu_length,
    Dwarf_Error * dw_error )
```

For a CU entry in the list return the offset and length.

#### Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_entryindex</i>	Pass in a number from 0 through dw_list_length-1. If dw_entryindex is too large for the array the function returns DW_DLV_NO_ENTRY.
<i>dw_cu_offset</i>	On success returns the CU offset for this list entry.
<i>dw_cu_length</i>	On success returns the CU length(in bytes) for this list entry.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.29.2.6 dwarf\_gdbindex\_cuvector\_inner\_attributes()

```
DW_API int dwarf_gdbindex_cuvector_inner_attributes (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned dw_cuvector_offset_in,
    Dwarf_Unsigned dw_innerindex,
    Dwarf_Unsigned * dw_field_value,
    Dwarf_Error * dw_error )
```

Get access to a cuvector.

## Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_cuvector_offset_in</i>	Pass in the value of dw_cuvector_offset
<i>dw_innerindex</i>	Pass in the index of the CU vector in, from 0 through dw_innercount-1.
<i>dw_field_value</i>	On success returns a field of bits. To expand the bits call dwarf_gdbindex_cuvector_instance_expand_value.
<i>dw_error</i>	The usual pointer to return error details.

## Returns

Returns DW\_DLV\_OK etc.

### 9.29.2.7 dwarf\_gdbindex\_cuvector\_instance\_expand\_value()

```
DW_API int dwarf_gdbindex_cuvector_instance_expand_value (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned dw_field_value,
    Dwarf_Unsigned * dw_cu_index,
    Dwarf_Unsigned * dw_symbol_kind,
    Dwarf_Unsigned * dw_is_static,
    Dwarf_Error * dw_error )
```

Expand the bit fields in a cuvector entry.

## Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_field_value</i>	Pass in the dw_field_value returned by dwarf_gdbindex_cuvector_inner_attributes.
<i>dw_cu_index</i>	On success returns the CU index from the dw_field_value
<i>dw_symbol_kind</i>	On success returns the symbol kind (see the sourceware page. Kinds are TYPE, VARIABLE, or FUNCTION).
<i>dw_is_static</i>	On success returns non-zero if the entry is a static symbol (file-local, as in C or C++), otherwise it returns non-zero and the symbol is global.
<i>dw_error</i>	The usual pointer to return error details.

## Returns

Returns DW\_DLV\_OK etc.

### 9.29.2.8 dwarf\_gdbindex\_cuvector\_length()

```
DW_API int dwarf_gdbindex_cuvector_length (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned dw_cuvector_offset,
    Dwarf_Unsigned * dw_innercount,
    Dwarf_Error * dw_error )
```

Get access to a cuvector.

See also

[Reading the gdbindex symbol table](#)

#### Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_cuvector_offset</i>	Pass in the offset, dw_cu_vector_offset.
<i>dw_innercount</i>	On success returns the number of CUs in the cuvector instance array.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.29.2.9 dwarf\_gdbindex\_header()

```
DW_API int dwarf_gdbindex_header (
    Dwarf_Debug dw_dbg,
    Dwarf_Gdbindex * dw_gdbindexptr,
    Dwarf_Unsigned * dw_version,
    Dwarf_Unsigned * dw_cu_list_offset,
    Dwarf_Unsigned * dw_types_cu_list_offset,
    Dwarf_Unsigned * dw_address_area_offset,
    Dwarf_Unsigned * dw_symbol_table_offset,
    Dwarf_Unsigned * dw_constant_pool_offset,
    Dwarf_Unsigned * dw_section_size,
    const char ** dw_section_name,
    Dwarf_Error * dw_error )
```

Open access to the .gdb\_index section.

The section is a single table one thinks.

See also

[Reading gdbindex data](#)

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_gdbindexptr</i>	On success returns a pointer to make access to table details possible.
<i>dw_version</i>	On success returns the table version.
<i>dw_cu_list_offset</i>	On success returns the offset of the cu_list in the section.
<i>dw_types_cu_list_offset</i>	On success returns the offset of the types cu_list in the section.
<i>dw_address_area_offset</i>	On success returns the area pool offset.
<i>dw_symbol_table_offset</i>	On success returns the symbol table offset.
<i>dw_constant_pool_offset</i>	On success returns the constant pool offset.
<i>dw_section_size</i>	On success returns section size.
<i>dw_section_name</i>	On success returns section name.
<i>dw_error</i>	The usual pointer to return error details.

**Returns**

Returns DW\_DLV\_OK etc. Returns DW\_DLV\_NO\_ENTRY if the section is absent.

**9.29.2.10 dwarf\_gdbindex\_string\_by\_offset()**

```
DW_API int dwarf_gdbindex_string_by_offset (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned dw_stringoffset,
    const char ** dw_string_ptr,
    Dwarf_Error * dw_error )
```

Retrieve a symbol name from the index data.

**Parameters**

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_stringoffset</i>	Pass in the string offset returned by dwarf_gdbindex_symboltable_entry
<i>dw_string_ptr</i>	On success returns a pointer to the null-terminated string.
<i>dw_error</i>	The usual pointer to return error details.

**Returns**

Returns DW\_DLV\_OK etc.

**9.29.2.11 dwarf\_gdbindex\_symboltable\_array()**

```
DW_API int dwarf_gdbindex_symboltable_array (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned * dw_symtab_list_length,
    Dwarf_Error * dw_error )
```

Get access to the symboltable array.

**Parameters**

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_symtab_list_length</i>	On success returns the number of entries in the symbol table
<i>dw_error</i>	The usual pointer to return error details.

**Returns**

Returns DW\_DLV\_OK etc.

**9.29.2.12 dwarf\_gdbindex\_symboltable\_entry()**

```
DW_API int dwarf_gdbindex_symboltable_entry (
    Dwarf_Gdbindex dw_gdbindexptr,
```

```

Dwarf_Unsigned dw_entryindex,
Dwarf_Unsigned * dw_string_offset,
Dwarf_Unsigned * dw_cu_vector_offset,
Dwarf_Error * dw_error )

```

Access individual symtab entry.

#### Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_entryindex</i>	Pass in a valid index in the range 0 through dw_symtab_list_length-1. If the value is greater than dw_symtab_list_length-1 the function returns DW_DLV_NO_ENTRY;
<i>dw_string_offset</i>	On success returns the string offset in the appropriate string section.
<i>dw_cu_vector_offset</i>	On success returns the CU vector offset.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.29.2.13 dwarf\_gdbindex\_types\_culist\_array()

```

DW_API int dwarf_gdbindex_types_culist_array (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned * dw_types_list_length,
    Dwarf_Error * dw_error )

```

Return the types culist array length.

#### Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_types_list_length</i>	On success returns the array length of the types cu list.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.29.2.14 dwarf\_gdbindex\_types\_culist\_entry()

```

DW_API int dwarf_gdbindex_types_culist_entry (
    Dwarf_Gdbindex dw_gdbindexptr,
    Dwarf_Unsigned dw_types_entryindex,
    Dwarf_Unsigned * dw_cu_offset,
    Dwarf_Unsigned * dw_tu_offset,
    Dwarf_Unsigned * dw_type_signature,
    Dwarf_Error * dw_error )

```

For a types CU entry in the list returns the offset and length.

## Parameters

<i>dw_gdbindexptr</i>	Pass in the Dwarf_Gdbindex pointer of interest.
<i>dw_types_entryindex</i>	Pass in a number from 0 through dw_list_length-1. If the value is greater than dw_list_length-1 the function returns DW_DLV_NO_ENTRY.
<i>dw_cu_offset</i>	On success returns the types CU offset for this list entry.
<i>dw_tu_offset</i>	On success returns the tu offset for this list entry.
<i>dw_type_signature</i>	On success returns the type unit offset for this entry if the type has a signature.
<i>dw_error</i>	The usual pointer to return error details.

## Returns

Returns DW\_DLV\_OK etc.

## 9.30 Fast Access to Split Dwarf (Debug Fission)

## Functions

- DW\_API int [dwarf\\_get\\_xu\\_index\\_header](#) (Dwarf\_Debug dw\_dbg, const char \*dw\_section\_type, Dwarf\_Xu\_Index\_Header \*dw\_xuhdr, Dwarf\_Unsigned \*dw\_version\_number, Dwarf\_Unsigned \*dw\_section\_count, Dwarf\_Unsigned \*dw\_units\_count, Dwarf\_Unsigned \*dw\_hash\_slots\_count, const char \*\*dw\_sect\_name, Dwarf\_Error \*dw\_error)  
*Access a .debug\_cu\_index or dw\_tu\_index section.*
- DW\_API void [dwarf\\_dealloc\\_xu\\_header](#) (Dwarf\_Xu\_Index\_Header dw\_xuhdr)  
*Dealloc (free) memory associated with dw\_xuhdr.*

*Given a hash signature find per-cu Fission data.*

### 9.30.1 Detailed Description

### 9.30.2 Function Documentation

#### 9.30.2.1 dwarf\_dealloc\_xu\_header()

```
DW_API void dwarf_dealloc_xu_header (
    Dwarf_Xu_Index_Header dw_xuhdr )
```

Dealloc (free) memory associated with dw\_xuhdr.

Should be named dwarf\_dealloc\_xuhdr instead.

##### Parameters

<i>dw_xuhdr</i>	Dealloc (free) all associated memory. The caller should zero the passed in value on return as it is then a stale value.
-----------------	---

#### 9.30.2.2 dwarf\_get\_debugfission\_for\_die()

```
DW_API int dwarf_get_debugfission_for_die (
    Dwarf_Die dw_die,
    Dwarf_Debug_Fission_Per_CU * dw_percu_out,
    Dwarf_Error * dw_error )
```

Get debugfission data for a Dwarf\_Die.

For any Dwarf\_Die in a compilation unit, return the debug fission table data through dw\_percu\_out. Usually applications will pass in the CU die. Calling code should zero all of the struct [Dwarf\\_Debug\\_Fission\\_Per\\_CU\\_s](#) before calling this. If there is no debugfission data this returns DW\_DLV\_NO\_ENTRY (only .dwp objects have debugfission data)

##### Parameters

<i>dw_die</i>	Pass in a Dwarf_Die pointer, Usually pass in a CU DIE pointer.
<i>dw_percu_out</i>	Pass in a pointer to a zeroed structure. On success the function fills in the structure.
<i>dw_error</i>	The usual pointer to return error details.

##### Returns

Returns DW\_DLV\_OK etc.

#### 9.30.2.3 dwarf\_get\_debugfission\_for\_key()

```
DW_API int dwarf_get_debugfission_for_key (
    Dwarf_Debug dw_dbg,
    Dwarf_Sig8 * dw_hash_sig,
    const char * dw_cu_type,
```

```
Dwarf_Debug_Fission_Per_CU * dw_percu_out,  
Dwarf_Error * dw_error )
```

Given a hash signature find per-cu Fission data.

## Parameters

<i>dw_dbg</i>	Pass in the Dwarf_Debug of interest.
<i>dw_hash_sig</i>	Pass in a pointer to a Dwarf_Sig8 containing a hash value of interest.
<i>dw_cu_type</i>	Pass in the type, a string. Either "cu" or "tu".
<i>dw_percu_out</i>	Pass in a pointer to a zeroed structure. On success the function fills in the structure.
<i>dw_error</i>	The usual pointer to return error details.

## Returns

Returns DW\_DLV\_OK etc.

## 9.30.2.4 dwarf\_get\_xu\_hash\_entry()

```
DW_API int dwarf_get_xu_hash_entry (
    Dwarf_Xu_Index_Header dw_xuhdr,
    Dwarf_Unsigned dw_index,
    Dwarf_Sig8 * dw_hash_value,
    Dwarf_Unsigned * dw_index_to_sections,
    Dwarf_Error * dw_error )
```

Get a Hash Entry.

## See also

[examplez/x](#)

## Parameters

<i>dw_xuhdr</i>	Pass in an open header pointer.
<i>dw_index</i>	Pass in the index of the entry you wish. Valid index values are 0 through <b>S-1</b> . If the <i>dw_index</i> passed in is outside the valid range the functionj
<i>dw_hash_value</i>	Pass in a pointer to a Dwarf_Sig8. On success the hash struct is filled in with the 8 byte hash value.
<i>dw_index_to_sections</i>	On success returns the offset/size table index for this hash entry.
<i>dw_error</i>	The usual pointer to return error details.

## Returns

Returns DW\_DLV\_OK on success. If the *dw\_index* passed in is outside the valid range the function it returns DW\_DLV\_NO\_ENTRY (before version 0.7.0 it returned DW\_DLV\_ERROR, though nothing mentioned that). In case of error it returns DW\_DLV\_ERROR. If *dw\_error* is non-null returns error details through *dw\_error* (the usual error behavior).

## 9.30.2.5 dwarf\_get\_xu\_index\_header()

```
DW_API int dwarf_get_xu_index_header (
    Dwarf_Debug dw_dbg,
```

```

const char * dw_section_type,
Dwarf_Xu_Index_Header * dw_xuhdr,
Dwarf_Unsigned * dw_version_number,
Dwarf_Unsigned * dw_section_count,
Dwarf_Unsigned * dw_units_count,
Dwarf_Unsigned * dw_hash_slots_count,
const char ** dw_sect_name,
Dwarf_Error * dw_error )

```

Access a .debug\_cu\_index or dw\_tu\_index section.

These sections are in a DWARF5 package file, a file normally named with the .dwo or .dwp extension.. See DWARF5 section 7.3.5.3 Format of the CU and TU Index Sections.

#### Parameters

<i>dw_dbg</i>	Pass in the Dwarf_Debug of interest
<i>dw_section_type</i>	Pass in a pointer to either "cu" or "tu".
<i>dw_xuhdr</i>	On success, returns a pointer usable in further calls.
<i>dw_version_number</i>	On success returns five.
<i>dw_section_count</i>	On success returns the number of entries in the table of section counts. Referred to as <b>N</b> .
<i>dw_units_count</i>	On success returns the number of compilation units or type units in the index. Referred to as <b>U</b> .
<i>dw_hash_slots_count</i>	On success returns the number of slots in the hash table. Referred to as <b>S</b> .
<i>dw_sect_name</i>	On success returns a pointer to the name of the section. Do not free/dealloc the returned pointer.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc. Returns DW\_DLV\_NO\_ENTRY if the section requested is not present.

### 9.30.2.6 dwarf\_get\_xu\_index\_section\_type()

```

DW_API int dwarf_get_xu_index_section_type (
    Dwarf_Xu_Index_Header dw_xuhdr,
    const char ** dw_typename,
    const char ** dw_sectionname,
    Dwarf_Error * dw_error )

```

Return basic information about a Dwarf\_Xu\_Index\_Header.

#### Parameters

<i>dw_xuhdr</i>	Pass in an open header pointer.
<i>dw_typename</i>	On success returns a pointer to the immutable string "tu" or "cu". Do not free.
<i>dw_sectionname</i>	On success returns a pointer to the section name in the object file. Do not free.
<i>dw_error</i>	The usual pointer to return error details.

**Returns**

Returns DW\_DLV\_OK etc.

**9.30.2.7 dwarf\_get\_xu\_section\_names()**

```
DW_API int dwarf_get_xu_section_names (
    Dwarf_Xu_Index_Header dw_xuhdr,
    Dwarf_Unsigned dw_column_index,
    Dwarf_Unsigned * dw_SECT_number,
    const char ** dw_SECT_name,
    Dwarf_Error * dw_error )
```

get DW\_SECT value for a column.

**See also**

[Reading Split Dwarf \(Debug Fission\) data](#)

**Parameters**

<i>dw_xuhdr</i>	Pass in an open header pointer.
<i>dw_column_index</i>	The section names are in row zero of the table so we do not mention the row number at all. Pass in the column of the entry you wish. Valid dw_column_index values are 0 through <b>N-1</b> .
<i>dw_SECT_number</i>	On success returns DW_SECT_INFO or other section id as appears in dw_column_index.
<i>dw_SECT_name</i>	On success returns a pointer to the string with the section name.
<i>dw_error</i>	The usual pointer to return error details.

**Returns**

Returns DW\_DLV\_OK etc.

**9.30.2.8 dwarf\_get\_xu\_section\_offset()**

```
DW_API int dwarf_get_xu_section_offset (
    Dwarf_Xu_Index_Header dw_xuhdr,
    Dwarf_Unsigned dw_row_index,
    Dwarf_Unsigned dw_column_index,
    Dwarf_Unsigned * dw_sec_offset,
    Dwarf_Unsigned * dw_sec_size,
    Dwarf_Error * dw_error )
```

Get row data (section data) for a row and column.

The section offset represents a base offset for the section the row data refers to. DWARF6 Section 7.3.5.3 page 193.

## Parameters

<i>dw_xuhdr</i>	Pass in an open header pointer.
<i>dw_row_index</i>	Pass in a row number , 1 through <b>U</b>
<i>dw_column_index</i>	Pass in a column number , 0 through <b>N-1</b>
<i>dw_sec_offset</i>	On success returns the section offset of the section whose name <code>dwarf_get_xu_section_names</code> returns.
<i>dw_sec_size</i>	On success returns the section size of the section whose name <code>dwarf_get_xu_section_names</code> returns. If the returned section size is zero then this column makes no contribution to the dwp object file and the <code>dw_sec_size</code> and <code>dw_sec_offset</code> should be ignored.
<i>dw_error</i>	The usual pointer to return error details.

## Returns

Returns DW\_DLV\_OK etc.

## 9.31 Access GNU .gnu\_debuglink, build-id.

## Functions

- DW\_API int `dwarf_gnu_debuglink` (`Dwarf_Debug` dw\_dbg, char \*\*dw\_debuglink\_path\_returned, unsigned char \*\*dw\_crc\_returned, char \*\*dw\_debuglink\_fullpath\_returned, unsigned int \*dw\_debuglink\_path\_length\_returned, unsigned int \*dw\_buildid\_type\_returned, char \*\*dw\_buildid\_owner\_name\_returned, unsigned char \*\*dw\_buildid\_returned, unsigned int \*dw\_buildid\_length\_returned, char \*\*\*dw\_paths\_returned, unsigned int \*dw\_paths\_length\_returned, `Dwarf_Error` \*dw\_error)

*Find a separated DWARF object file.*

- DW\_API int `dwarf_suppress_debuglink_crc` (int dw\_suppress)

*Suppressing crc calculations.*

- DW\_API int `dwarf_add_debuglink_global_path` (`Dwarf_Debug` dw\_dbg, const char \*dw\_pathname, `Dwarf_Error` \*dw\_error)

*Adding debuglink global paths.*

- DW\_API int `dwarf_crc32` (`Dwarf_Debug` dw\_dbg, unsigned char \*dw\_crcbuf, `Dwarf_Error` \*dw\_error)

*Crc32 used for debuglink crc calculation.*

- DW\_API unsigned int `dwarf_basic_crc32` (const unsigned char \*dw\_buf, unsigned long dw\_len, unsigned int dw\_init)

*Public interface to the real crc calculation.*

### 9.31.1 Detailed Description

When DWARF sections are in a different object than the executable or a normal shared object. The special GNU section provides a way to name the object file with DWARF.

libdwarf will attempt to use this data to find the object file with DWARF.

Has nothing to do with split-dwarf/debug-fission.

## 9.31.2 Function Documentation

### 9.31.2.1 dwarf\_add\_debuglink\_global\_path()

```
DW_API int dwarf_add_debuglink_global_path (
    Dwarf_Debug dw_dbg,
    const char * dw_pathname,
    Dwarf_Error * dw_error )
```

Adding debuglink global paths.

Used inside src/bin/dwarfexample/dwdebuglink.c so we can show all that is going on. The following has the explanation for how debuglink and global paths interact:

See also

<https://sourceware.org/gdb/onlinedocs/gdb/Separate-Debug-Files.html>

#### Parameters

<i>dw_dbg</i>	Pass in the Dwarf_Debug of interest.
<i>dw_pathname</i>	Pass in a pathname to add to the list of global paths used by debuglink.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

### 9.31.2.2 dwarf\_basic\_crc32()

```
DW_API unsigned int dwarf_basic_crc32 (
    const unsigned char * dw_buf,
    unsigned long dw_len,
    unsigned int dw_init )
```

Public interface to the real crc calculation.

It is unlikely this is useful. The calculation will not produce a return matching that of Linux/Macos if the compiler implements unsigned int or signed int as 16 bits long.

The caller must guarantee that dw\_buf is non-null and pointing to dw\_len bytes of readable memory. If dw\_buf is NULL then 0 is immediately returned and there is no indication of error.

#### Parameters

<i>dw_buf</i>	Pass in a pointer to some bytes on which the crc calculation as done in debuglink is to be done.
<i>dw_len</i>	Pass in the length in bytes of dw_buf.
<i>dw_init</i>	Pass in the initial 32 bit value, zero is the right choice.

**Returns**

Returns an int (assumed 32 bits int!) with the calculated crc.

**9.31.2.3 dwarf\_crc32()**

```
DW_API int dwarf_crc32 (
    Dwarf_Debug dw_dbg,
    unsigned char * dw_crcbuf,
    Dwarf_Error * dw_error )
```

Crc32 used for debuglink crc calculation.

Caller passes pointer to array of 4 unsigned char provided by the caller and if this returns DW\_DLV\_OK that array is filled in.

Callers must guarantee dw\_crcbuf points to at least 4 bytes of writable memory. Passing in a null dw\_crcbuf results in an immediate return of DW\_DLV\_NO\_ENTRY and the pointer is not used.

**Parameters**

<i>dw_dbg</i>	Pass in an open dw_dbg. When you attempted to open it, and it succeeded then pass the it via the Dwarf_Debug The function reads the file into memory and performs a crc calculation.
<i>dw_crcbuf</i>	Pass in a pointer to a 4 byte area to hold the returned crc, on success the function puts the 4 bytes there.
<i>dw_error</i>	The usual pointer to return error details.

**Returns**

Returns DW\_DLV\_OK etc.

**9.31.2.4 dwarf\_gnu\_debuglink()**

```
DW_API int dwarf_gnu_debuglink (
    Dwarf_Debug dw_dbg,
    char ** dw_debuglink_path_returned,
    unsigned char ** dw_crc_returned,
    char ** dw_debuglink_fullpath_returned,
    unsigned int * dw_debuglink_path_length_returned,
    unsigned int * dw_buildid_type_returned,
    char ** dw_buildid_owner_name_returned,
    unsigned char ** dw_buildid_returned,
    unsigned int * dw_buildid_length_returned,
    char *** dw_paths_returned,
    unsigned int * dw_paths_length_returned,
    Dwarf_Error * dw_error )
```

Find a separated DWARF object file.

.gnu\_debuglink and/or the section .note.gnu.build-id.

Unless something is odd and you want to know details of the two sections you will not need this function.

See also

<https://sourceware.org/gdb/onlinedocs/gdb/Separate-Debug-Files.html>  
[Using GNU debuglink data](#)

If no debuglink then name\_returned, crc\_returned and debuglink\_path\_returned will get set 0 through the pointers.

If no .note.gnu.build-id then buildid\_length\_returned, and buildid\_returned will be set 0 through the pointers.

In most cases output arguments can be passed as zero and the function will simply not return data through such arguments. Useful if you only care about some of the data potentially returned.

If dw\_debuglink\_fullpath\_returned is set by the call the space allocated must be freed by the caller with free(dw\_↵ debuglink\_fullpath\_returned).

if dw\_debuglink\_paths\_returned is set by the call the space allocated must be free by the caller with free(dw\_↵ debuglink\_paths\_returned).

[dwarf\\_finish\(\)](#) will not free strings dw\_debuglink\_fullpath\_returned or dw\_debuglink\_paths\_returned.

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_debuglink_path_returned</i>	On success returns a pointer to a path in the debuglink section. Do not free!
<i>dw_crc_returned</i>	On success returns a pointer to a 4 byte area through the pointer.
<i>dw_debuglink_fullpath_returned</i>	On success returns a pointer to a full path computed from debuglink data of a correct path to a file with DWARF sections. Free this string when no longer of interest.
<i>dw_debuglink_path_length_returned</i>	On success returns the strlen() of dw_debuglink_fullpath_returned .
<i>dw_buildid_type_returned</i>	On success returns a pointer to integer with a type code. See the buildid definition.
<i>dw_buildid_owner_name_returned</i>	On success returns a pointer to the owner name from the buildid section. Do not free this.
<i>dw_buildid_returned</i>	On success returns a pointer to a sequence of bytes containing the buildid.
<i>dw_buildid_length_returned</i>	On success this is set to the length of the set of bytes pointed to by dw_buildid_returned .
<i>dw_paths_returned</i>	On success sets a pointer to an array of pointers to strings, each with a global path. These strings must be freed by the caller, <a href="#">dwarf_finish()</a> will not free these strings. Call free(dw_paths_returned).
<i>dw_paths_length_returned</i>	On success returns the length of the array of string pointers dw_paths_returned points at.
<i>dw_error</i>	The usual pointer to return error details.

#### Returns

Returns DW\_DLV\_OK etc.

#### 9.31.2.5 dwarf\_suppress\_debuglink\_crc()

```
DW_API int dwarf_suppress_debuglink_crc (
    int dw_suppress )
```

Suppressing crc calculations.

The `.gnu_debuglink` section contains a compilation-system created crc (4 byte) value. If `dwarf_init_path[_dl]()` is called such a section can result in the reader/consumer calculating the crc value of a different object file. Which on a large object file could seem slow. See [https://en.wikipedia.org/wiki/Cyclic\\_redundancy\\_check](https://en.wikipedia.org/wiki/Cyclic_redundancy_check)

When one is confident that any `debug_link` file found is the appropriate one one can call `dwarf_suppress_debuglink_crc` with a non-zero argument and any `dwarf_init_path[_dl]` call will skip debuglink crc calculations and just assume the crc would match whenever it applies. This is a global flag, applies to all Dwarf\_Debug opened after the call in the program execution.

Does not apply to the `.note.gnu.buildid` section as that section never implies the reader/consumer needs to do a crc calculation.

#### Parameters

<code>dw_suppress</code>	Pass in 1 to suppress future calculation of crc values to verify a debuglink target is correct. So use only when you know this is safe. Pass in 0 to ensure future <code>dwarf_init_path[_dl]</code> calls compute debuglink CRC values as required.
--------------------------	--

#### Returns

Returns the previous value of the global flag.

[Details on separate DWARF object access](#)

## 9.32 Harmless Error recording

### Macros

- `#define DW_HARMLESS_ERROR_CIRCULAR_LIST_DEFAULT_SIZE 4`  
*Default size of the libdwarf-internal circular list.*

### Functions

- DW\_API int `dwarf_get_harmless_error_list` (Dwarf\_Debug dw\_dbg, unsigned int dw\_count, const char \*\*dw\_errmsg\_ptrs\_array, unsigned int \*dw\_newerr\_count)  
*Get the harmless error count and content.*
- DW\_API unsigned int `dwarf_set_harmless_error_list_size` (Dwarf\_Debug dw\_dbg, unsigned int dw\_maxcount)  
*The size of the circular list of strings libdwarf holds internally may be set and reset as needed. If it is shortened excess messages are simply dropped. It returns the previous size. If zero passed in the size is unchanged and it simply returns the current size.*
- DW\_API int `dwarf_set_harmless_errors_enabled` (Dwarf\_Debug dw\_dbg, int dw\_v)  
*Enable or disable libdwarf tracking of harmless errors. Harmless errors are used by tools like dwarfdump. Disabling harmless errors can improve performance by avoiding string copies. Defaults to enabled.*
- DW\_API void `dwarf_insert_harmless_error` (Dwarf\_Debug dw\_dbg, char \*dw\_newerror)  
*Harmless Error Insertion is only for testing.*

### 9.32.1 Detailed Description

The harmless error list is a fixed size circular buffer of errors we note but which do not stop us from processing the object. Created so dwarfdump or other tools can report such inconsequential errors without causing anything to stop early.

You can change the list size from the default of DW\_HARMLESS\_ERROR\_CIRCULAR\_LIST\_DEFAULT\_SIZE at any time for a Dwarf\_Debug dbg.

Harmless error data is dealloc'd by `dwarf_finish()`.

### 9.32.2 Function Documentation

#### 9.32.2.1 dwarf\_get\_harmless\_error\_list()

```
DW_API int dwarf_get_harmless_error_list (
    Dwarf_Debug dw_dbg,
    unsigned int dw_count,
    const char ** dw_errmsg_ptrs_array,
    unsigned int * dw_newerr_count )
```

Get the harmless error count and content.

User code supplies size of array of pointers dw\_errmsg\_ptrs\_array in count and the array of pointers (the pointers themselves need not be initialized). The pointers returned in the array of pointers are invalidated by ANY call to libdwarf. Use them before making another libdwarf call! The array of string pointers passed in always has a final null pointer, so if there are N pointers and M actual strings, then MIN(M,N-1) pointers are set to point to error strings. The array of pointers to strings always terminates with a NULL pointer. Do not free the strings. Every string is null-terminated.

Each call empties the error list (discarding all current entries). and fills in your array

#### Parameters

<i>dw_dbg</i>	The applicable Dwarf_Debug.
<i>dw_count</i>	The number of string buffers. If count is passed as zero no elements of the array are touched.
<i>dw_errmsg_ptrs_array</i>	A pointer to a user-created array of pointer to const char.
<i>dw_newerr_count</i>	If non-NULL the count of harmless errors pointers since the last call is returned through the pointer. If dw_count is greater than zero the first dw_count of the pointers in the user-created array point to null-terminated strings. Do not free the strings. print or copy the strings before any other libdwarf call.

#### Returns

Returns DW\_DLV\_NO\_ENTRY if no harmless errors were noted so far. Returns DW\_DLV\_OK if there are harmless errors. Never returns DW\_DLV\_ERROR.

If DW\_DLV\_NO\_ENTRY is returned none of the arguments other than dw\_dbg are touched or used.

### 9.32.2.2 dwarf\_insert\_harmless\_error()

```
DW_API void dwarf_insert_harmless_error (
    Dwarf_Debug dw_dbg,
    char * dw_newerror )
```

Harmless Error Insertion is only for testing.

Useful for testing the harmless error mechanism.

#### Parameters

<i>dw_dbg</i>	Pass in an open Dwarf_Debug
<i>dw_newerror</i>	Pass in a string whose content the function inserts as a harmless error (which dwarf_get_harmless_error_list will retrieve).

### 9.32.2.3 dwarf\_set\_harmless\_error\_list\_size()

```
DW_API unsigned int dwarf_set_harmless_error_list_size (
    Dwarf_Debug dw_dbg,
    unsigned int dw_maxcount )
```

The size of the circular list of strings libdwarf holds internally may be set and reset as needed. If it is shortened excess messages are simply dropped. It returns the previous size. If zero passed in the size is unchanged and it simply returns the current size.

#### Parameters

<i>dw_dbg</i>	The applicable Dwarf_Debug.
<i>dw_maxcount</i>	Set the new internal buffer count to a number greater than zero.

#### Returns

returns the current size of the internal circular buffer if dw\_maxcount is zero. If dw\_maxcount is greater than zero the internal array is adjusted to hold that many and the previous number of harmless errors possible in the circular buffer is returned.

### 9.32.2.4 dwarf\_set\_harmless\_errors\_enabled()

```
DW_API int dwarf_set_harmless_errors_enabled (
    Dwarf_Debug dw_dbg,
    int dw_v )
```

Enable or disable libdwarf tracking of harmless errors. Harmless errors are used by tools like dwarfdump. Disabling harmless errors can improve performance by avoiding string copies. Defaults to enabled.

#### Parameters

<i>dw_dbg</i>	Pass in an open Dwarf_Debug
<i>dw_v</i>	If zero passed in, harmless errors will not be tracked and libdwarf will run somewhat faster. If non-zero passed in libdwarf will resume or continue tracking harmless errors

## Returns

Returns the previous version of the flag.

## 9.33 Names DW\_TAG\_member etc as strings

## Functions

- DW\_API int **dwarf\_get\_GNUIVIS\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_GNUIVIS\_name* - a libdwarf invention
- DW\_API int **dwarf\_get\_ID\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_ID\_name*
- DW\_API int **dwarf\_get\_IDX\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_IDX\_name*
- DW\_API int **dwarf\_get\_INL\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_INL\_name*

- DW\_API int **dwarf\_get\_ISA\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_ISA\_name*
- DW\_API int **dwarf\_get\_LANG\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_LANG\_name*
- DW\_API int **dwarf\_get\_LLE\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_LLE\_name*
- DW\_API int **dwarf\_get\_LLEX\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_LLEX\_name* - a GNU extension.
- DW\_API int **dwarf\_get\_LNAME\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_LNAME*
- DW\_API int **dwarf\_get\_LNCT\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_LNCT\_name*
- DW\_API int **dwarf\_get\_LNE\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_LNE\_name*
- DW\_API int **dwarf\_get\_LNS\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_LNS\_name*
- DW\_API int **dwarf\_get\_MACINFO\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_MACINFO\_name*
- DW\_API int **dwarf\_get\_MACRO\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_MACRO\_name*
- DW\_API int **dwarf\_get\_OP\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_OP\_name*
- DW\_API int **dwarf\_get\_ORD\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_ORD\_name*
- DW\_API int **dwarf\_get\_RLE\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_RLE\_name*
- DW\_API int **dwarf\_get\_SECT\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_SECT\_name*
- DW\_API int **dwarf\_get\_TAG\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_TAG\_name*
- DW\_API int **dwarf\_get\_UT\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_UT\_name*
- DW\_API int **dwarf\_get\_VIRTUALITY\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_VIRTUALITY\_name*
- DW\_API int **dwarf\_get\_VIS\_name** (unsigned int dw\_val\_in, const char \*\*dw\_s\_out)  
*dwarf\_get\_VIS\_name*
- DW\_API int **dwarf\_get\_FORM\_CLASS\_name** (enum [Dwarf\\_Form\\_Class](#) dw\_fc, const char \*\*dw\_s\_out)  
*dwarf\_get\_FORM\_CLASS\_name* is for a libdwarf extension. Not defined by the DWARF standard though the concept is defined in the standard. It seemed essential to invent it for libdwarf to report correctly.

### 9.33.1 Detailed Description

Given a value you know is one of a particular name category in DWARF2 or later, call the appropriate function and on finding the name it returns DW\_DLV\_OK and sets the identifier for the value through a pointer. On success these functions return the string corresponding to **dw\_val\_in** passed in through the pointer **dw\_s\_out** and the value returned is DW\_DLV\_OK.

The strings returned on success are in static storage and must not be freed.

These functions are generated from information in [dwarf.h](#), not hand coded functions.

If DW\_DLV\_NO\_ENTRY is returned the **dw\_val\_in** is not known and **\*s\_out** is not set. This is unusual.

DW\_DLV\_ERROR is never returned.

The example referred to offers the suggested way to use functions like these.

## 9.33.2 Function Documentation

### 9.33.2.1 dwarf\_get\_EH\_name()

```
DW_API int dwarf_get_EH_name (
    unsigned int dw_val_in,
    const char ** dw_s_out )
```

dwarf\_get\_EH\_name

So we can report this GNU extension sensibly.

### 9.33.2.2 dwarf\_get\_FORM\_CLASS\_name()

```
DW_API int dwarf_get_FORM_CLASS_name (
    enum Dwarf_Form_Class dw_fc,
    const char ** dw_s_out )
```

dwarf\_get\_FORM\_CLASS\_name is for a libdwarf extension. Not defined by the DWARF standard though the concept is defined in the standard. It seemed essential to invent it for libdwarf to report correctly.

See DWARF5 Table 2.3, Classes of Attribute Value page 23. Earlier DWARF versions have a similar table.

### 9.33.2.3 dwarf\_get\_FRAME\_name()

```
DW_API int dwarf_get_FRAME_name (
    unsigned int dw_val_in,
    const char ** dw_s_out )
```

This is a set of register names.

The set of register names is unlikely to match your register set, but perhaps this is better than no name.

### 9.33.2.4 dwarf\_get\_GNUKIND\_name()

```
DW_API int dwarf_get_GNUKIND_name (
    unsigned int dw_val_in,
    const char ** dw_s_out )
```

dwarf\_get\_GNUKIND\_name - libdwarf invention

So we can report things GNU extensions sensibly.

#### 9.33.2.5 dwarf\_get\_GNUIVIS\_name()

```
DW_API int dwarf_get_GNUIVIS_name (
    unsigned int dw_val_in,
    const char ** dw_s_out )
```

dwarf\_get\_GNUIVIS\_name - a libdwarf invention

So we report a GNU extension sensibly.

#### 9.33.2.6 dwarf\_get\_LLEX\_name()

```
DW_API int dwarf_get_LLEX_name (
    unsigned int dw_val_in,
    const char ** dw_s_out )
```

dwarf\_get\_LLEX\_name - a GNU extension.

The name is a libdwarf invention for the GNU extension. So we report a GNU extension sensibly.

#### 9.33.2.7 dwarf\_get\_MACINFO\_name()

```
DW_API int dwarf_get_MACINFO_name (
    unsigned int dw_val_in,
    const char ** dw_s_out )
```

dwarf\_get\_MACINFO\_name

Used in DWARF2-DWARF4

#### 9.33.2.8 dwarf\_get\_MACRO\_name()

```
DW_API int dwarf_get_MACRO_name (
    unsigned int dw_val_in,
    const char ** dw_s_out )
```

dwarf\_get\_MACRO\_name

Used in DWARF5

## 9.34 Object Sections Data

### Functions

- DW\_API int [dwarf\\_get\\_die\\_section\\_name](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Bool dw\_is\_info, const char \*\*dw\_sec\_name, Dwarf\_Error \*dw\_error)  
*Get the real name a DIE section.*
- DW\_API int [dwarf\\_get\\_die\\_section\\_name\\_b](#) (Dwarf\_Die dw\_die, const char \*\*dw\_sec\_name, Dwarf\_Error \*dw\_error)  
*Get the real name of a DIE section.*
- DW\_API int [dwarf\\_get\\_macro\\_section\\_name](#) (Dwarf\_Debug dw\_dbg, const char \*\*dw\_sec\_name\_out, Dwarf\_Error \*dw\_err)  
*Get the real name of a .debug\_macro section.*
- DW\_API int [dwarf\\_get\\_real\\_section\\_name](#) (Dwarf\_Debug dw\_dbg, const char \*dw\_std\_section\_name, const char \*\*dw\_actual\_sec\_name\_out, Dwarf\_Small \*dw\_marked\_zcompressed, Dwarf\_Small \*dw\_marked\_zlib\_compressed, Dwarf\_Small \*dw\_marked\_shf\_compressed, Dwarf\_Unsigned \*dw\_compressed\_length, Dwarf\_Unsigned \*dw\_uncompressed\_length, Dwarf\_Error \*dw\_error)  
*Get the real name of a section.*
- DW\_API int [dwarf\\_get\\_frame\\_section\\_name](#) (Dwarf\_Debug dw\_dbg, const char \*\*dw\_section\_name\_out, Dwarf\_Error \*dw\_error)  
*Get .debug\_frame section name.*
- DW\_API int [dwarf\\_get\\_frame\\_section\\_name\\_eh\\_gnu](#) (Dwarf\_Debug dw\_dbg, const char \*\*dw\_section\_name\_out, Dwarf\_Error \*dw\_error)  
*Get GNU .eh\_frame section name.*
- DW\_API int [dwarf\\_get\\_aranges\\_section\\_name](#) (Dwarf\_Debug dw\_dbg, const char \*\*dw\_section\_name\_out, Dwarf\_Error \*dw\_error)  
*Get .debug\_aranges section name The usual arguments.*
- DW\_API int [dwarf\\_get\\_ranges\\_section\\_name](#) (Dwarf\_Debug dw\_dbg, const char \*\*dw\_section\_name\_out, Dwarf\_Error \*dw\_error)  
*Get .debug\_ranges section name The usual arguments and return values.*
- DW\_API int [dwarf\\_get\\_offset\\_size](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Half \*dw\_offset\_size, Dwarf\_Error \*dw\_error)  
*Get offset size as defined by the object.*
- DW\_API int [dwarf\\_get\\_address\\_size](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Half \*dw\_addr\_size, Dwarf\_Error \*dw\_error)  
*Get the address size as defined by the object.*
- DW\_API int [dwarf\\_get\\_string\\_section\\_name](#) (Dwarf\_Debug dw\_dbg, const char \*\*dw\_section\_name\_out, Dwarf\_Error \*dw\_error)  
*Get the string table section name The usual arguments and return values.*
- DW\_API int [dwarf\\_get\\_line\\_section\\_name](#) (Dwarf\_Debug dw\_dbg, const char \*\*dw\_section\_name\_out, Dwarf\_Error \*dw\_error)  
*Get the line table section name The usual arguments and return values.*
- DW\_API int [dwarf\\_get\\_line\\_section\\_name\\_from\\_die](#) (Dwarf\_Die dw\_die, const char \*\*dw\_section\_name\_out, Dwarf\_Error \*dw\_error)  
*Get the line table section name.*
- DW\_API int [dwarf\\_get\\_section\\_info\\_by\\_name\\_a](#) (Dwarf\_Debug dw\_dbg, const char \*dw\_section\_name, Dwarf\_Addr \*dw\_section\_addr, Dwarf\_Unsigned \*dw\_section\_size, Dwarf\_Unsigned \*dw\_section\_flags, Dwarf\_Unsigned \*dw\_section\_offset, Dwarf\_Error \*dw\_error)  
*Given a section name, get its size, address, etc.*
- DW\_API int [dwarf\\_get\\_section\\_info\\_by\\_name](#) (Dwarf\_Debug dw\_dbg, const char \*dw\_section\_name, Dwarf\_Addr \*dw\_section\_addr, Dwarf\_Unsigned \*dw\_section\_size, Dwarf\_Error \*dw\_error)  
*Given a section name, get its size and address.*

- DW\_API int [dwarf\\_get\\_section\\_info\\_by\\_index\\_a](#) (Dwarf\_Debug dw\_dbg, int dw\_section\_index, const char \*\*dw\_section\_name, Dwarf\_Addr \*dw\_section\_addr, Dwarf\_Unsigned \*dw\_section\_size, Dwarf\_Unsigned \*dw\_section\_flags, Dwarf\_Unsigned \*dw\_section\_offset, Dwarf\_Error \*dw\_error)  
*Given a section index, get its size and address, etc.*
- DW\_API int [dwarf\\_get\\_section\\_info\\_by\\_index](#) (Dwarf\_Debug dw\_dbg, int dw\_section\_index, const char \*\*dw\_section\_name, Dwarf\_Addr \*dw\_section\_addr, Dwarf\_Unsigned \*dw\_section\_size, Dwarf\_Error \*dw\_error)  
*Given a section index, get its size and address.*
- DW\_API int [dwarf\\_machine\\_architecture\\_a](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Small \*dw\_ftype, Dwarf\_Small \*dw\_obj\_pointersize, Dwarf\_Bool \*dw\_obj\_is\_big\_endian, Dwarf\_Unsigned \*dw\_obj\_machine, Dwarf\_Unsigned \*dw\_obj\_type, Dwarf\_Unsigned \*dw\_obj\_flags, Dwarf\_Small \*dw\_path\_source, Dwarf\_Unsigned \*dw\_ub\_offset, Dwarf\_Unsigned \*dw\_ub\_count, Dwarf\_Unsigned \*dw\_ub\_index, Dwarf\_Unsigned \*dw\_comdat\_groupnumber)  
*Get basic object information from Dwarf\_Debug.*
- DW\_API int [dwarf\\_machine\\_architecture](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Small \*dw\_ftype, Dwarf\_Small \*dw\_obj\_pointersize, Dwarf\_Bool \*dw\_obj\_is\_big\_endian, Dwarf\_Unsigned \*dw\_obj\_machine, Dwarf\_Unsigned \*dw\_obj\_flags, Dwarf\_Small \*dw\_path\_source, Dwarf\_Unsigned \*dw\_ub\_offset, Dwarf\_Unsigned \*dw\_ub\_count, Dwarf\_Unsigned \*dw\_ub\_index, Dwarf\_Unsigned \*dw\_comdat\_groupnumber)  
*Get basic object information original version.*
- DW\_API Dwarf\_Unsigned [dwarf\\_get\\_section\\_count](#) (Dwarf\_Debug dw\_dbg)  
*Get section count (of object file sections).*
- DW\_API int [dwarf\\_get\\_section\\_max\\_offsets\\_d](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Unsigned \*dw\_debug\_info\_size, Dwarf\_Unsigned \*dw\_debug\_abbrev\_size, Dwarf\_Unsigned \*dw\_debug\_line\_size, Dwarf\_Unsigned \*dw\_debug\_loc\_size, Dwarf\_Unsigned \*dw\_debug\_aranges\_size, Dwarf\_Unsigned \*dw\_debug\_macinfo\_size, Dwarf\_Unsigned \*dw\_debug\_pubnames\_size, Dwarf\_Unsigned \*dw\_debug\_str\_size, Dwarf\_Unsigned \*dw\_debug\_frame\_size, Dwarf\_Unsigned \*dw\_debug\_ranges\_size, Dwarf\_Unsigned \*dw\_debug\_pubtypes\_size, Dwarf\_Unsigned \*dw\_debug\_types\_size, Dwarf\_Unsigned \*dw\_debug\_macro\_size, Dwarf\_Unsigned \*dw\_debug\_str\_offsets\_size, Dwarf\_Unsigned \*dw\_debug\_sup\_size, Dwarf\_Unsigned \*dw\_debug\_cu\_index\_size, Dwarf\_Unsigned \*dw\_debug\_tu\_index\_size, Dwarf\_Unsigned \*dw\_debug\_names\_size, Dwarf\_Unsigned \*dw\_debug\_loclists\_size, Dwarf\_Unsigned \*dw\_debug\_rnglists\_size)  
*Get section sizes for many sections.*

### 9.34.1 Detailed Description

These functions are not often used. They give access to section- and objectfile-related information, and that sort of information is not generally needed to understand DWARF content..

Section name access. Because names sections such as .debug\_info might end with .dwo or be .zdebug or might not.

String pointers returned via these functions must not be freed, the strings are statically declared.

For non-Elf the name reported will be as if it were Elf sections. For example, not the names MacOS puts in its object sections (which the MacOS reader translates).

These calls returning selected object header {machine architecture, flags} and section {offset, flags} data are not of interest to most library callers: [dwarf\\_machine\\_architecture\(\)](#), [dwarf\\_get\\_section\\_info\\_by\\_index\\_a\(\)](#), and [dwarf\\_get\\_section\\_info\\_by\\_name\\_a\(\)](#).

The simple calls will not be documented in full detail here.

## 9.34.2 Function Documentation

### 9.34.2.1 dwarf\_get\_address\_size()

```
DW_API int dwarf_get_address_size (
    Dwarf_Debug dw_dbg,
    Dwarf_Half * dw_addr_size,
    Dwarf_Error * dw_error )
```

Get the address size as defined by the object.

This is not from DWARF information, it is from object file headers.

### 9.34.2.2 dwarf\_get\_die\_section\_name()

```
DW_API int dwarf_get_die_section_name (
    Dwarf_Debug dw_dbg,
    Dwarf_Bool dw_is_info,
    const char ** dw_sec_name,
    Dwarf_Error * dw_error )
```

Get the real name a DIE section.

#### dw\_is\_info

##### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest
<i>dw_is_info</i>	We do not pass in a DIE, so we have to pass in TRUE for for .debug_info, or if DWARF4 .debug_types pass in FALSE.
<i>dw_sec_name</i>	On success returns a pointer to the actual section name in the object file. Do not free the string.
<i>dw_error</i>	The usual error argument to report error details.

##### Returns

DW\_DLV\_OK etc.

### 9.34.2.3 dwarf\_get\_die\_section\_name\_b()

```
DW_API int dwarf_get_die_section_name_b (
    Dwarf_Die dw_die,
    const char ** dw_sec_name,
    Dwarf_Error * dw_error )
```

Get the real name of a DIE section.

The same as **dwarf\_get\_die\_section\_name** except we have a DIE so do not need **dw\_is\_info** as a argument.

#### 9.34.2.4 dwarf\_get\_frame\_section\_name()

```
DW_API int dwarf_get_frame_section_name (
    Dwarf_Debug dw_dbg,
    const char ** dw_section_name_out,
    Dwarf_Error * dw_error )
```

Get .debug\_frame section name.

##### Returns

returns DW\_DLV\_OK if the .debug\_frame exists

#### 9.34.2.5 dwarf\_get\_frame\_section\_name\_eh\_gnu()

```
DW_API int dwarf_get_frame_section_name_eh_gnu (
    Dwarf_Debug dw_dbg,
    const char ** dw_section_name_out,
    Dwarf_Error * dw_error )
```

Get GNU .eh\_frame section name.

##### Returns

Returns DW\_DLV\_OK if the .debug\_frame is present Returns DW\_DLV\_NO\_ENTRY if it is not present.

#### 9.34.2.6 dwarf\_get\_line\_section\_name\_from\_die()

```
DW_API int dwarf_get_line_section_name_from_die (
    Dwarf_Die dw_die,
    const char ** dw_section_name_out,
    Dwarf_Error * dw_error )
```

Get the line table section name.

##### Parameters

<i>dw_die</i>	Pass in a Dwarf_Die pointer.
<i>dw_section_name_out</i>	On success returns the section name, usually some .debug_info* name but in DWARF4 could be a .debug_types* name.
<i>dw_error</i>	On error returns the usual error pointer.

##### Returns

Returns DW\_DLV\_OK etc.

#### 9.34.2.7 dwarf\_get\_offset\_size()

```
DW_API int dwarf_get_offset_size (
    Dwarf_Debug dw_dbg,
```

```
Dwarf_Half * dw_offset_size,
Dwarf_Error * dw_error )
```

Get offset size as defined by the object.

This is not from DWARF information, it is from object file headers.

#### 9.34.2.8 dwarf\_get\_real\_section\_name()

```
DW_API int dwarf_get_real_section_name (
    Dwarf_Debug dw_dbg,
    const char * dw_std_section_name,
    const char ** dw_actual_sec_name_out,
    Dwarf_Small * dw_marked_zcompressed,
    Dwarf_Small * dw_marked_zlib_compressed,
    Dwarf_Small * dw_marked_shf_compressed,
    Dwarf_Unsigned * dw_compressed_length,
    Dwarf_Unsigned * dw_uncompressed_length,
    Dwarf_Error * dw_error )
```

Get the real name of a section.

If the object has section groups only the sections in the group in dw\_dbg will be found.

Whether .zdebug or ZLIB or SHF\_COMPRESSED is the marker there is just one uncompress algorithm (zlib) for all three cases.

##### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_std_section_name</i>	Pass in a standard section name, such as .debug_info or .debug_info.dwo .
<i>dw_actual_sec_name_out</i>	On success returns the actual section name from the object file.
<i>dw_marked_zcompressed</i>	On success returns TRUE if the original section name ends in .zdebug
<i>dw_marked_zlib_compressed</i>	On success returns TRUE if the section has the ZLIB string at the front of the section.
<i>dw_marked_shf_compressed</i>	On success returns TRUE if the section flag (Elf SHF_COMPRESSED) is marked as compressed.
<i>dw_compressed_length</i>	On success if the section was compressed it returns the original section length in the object file.
<i>dw_uncompressed_length</i>	On success if the section was compressed this returns the uncompressed length of the object section.
<i>dw_error</i>	On error returns the error usual details.

##### Returns

The usual DW\_DLV\_OK etc. If the section is not relevant to this Dwarf\_Debug or is not in the object file at all, returns DW\_DLV\_NO\_ENTRY

#### 9.34.2.9 dwarf\_get\_section\_count()

```
DW_API Dwarf_Unsigned dwarf_get_section_count (
    Dwarf_Debug dw_dbg )
```

Get section count (of object file sections).

Return the section count. Returns 0 if the `dw_dbg` argument is improper in any way.

#### Parameters

<code>dw_dbg</code>	Pass in a valid Dwarf_Debug of interest.
---------------------	--

#### Returns

Returns the count of sections in the object file or zero.

### 9.34.2.10 dwarf\_get\_section\_info\_by\_index()

```
DW_API int dwarf_get_section_info_by_index (
    Dwarf_Debug dw_dbg,
    int dw_section_index,
    const char ** dw_section_name,
    Dwarf_Addr * dw_section_addr,
    Dwarf_Unsigned * dw_section_size,
    Dwarf_Error * dw_error )
```

Given a section index, get its size and address.

See [dwarf\\_get\\_section\\_info\\_by\\_index\\_a\(\)](#) for the newest version which returns additional values.

Fields and meanings in [dwarf\\_get\\_section\\_info\\_by\\_index\(\)](#) are the same as in [dwarf\\_get\\_section\\_info\\_by\\_index\\_a\(\)](#) except that the arguments `dw_section_flags` and `dw_section_offset` are missing here.

### 9.34.2.11 dwarf\_get\_section\_info\_by\_index\_a()

```
DW_API int dwarf_get_section_info_by_index_a (
    Dwarf_Debug dw_dbg,
    int dw_section_index,
    const char ** dw_section_name,
    Dwarf_Addr * dw_section_addr,
    Dwarf_Unsigned * dw_section_size,
    Dwarf_Unsigned * dw_section_flags,
    Dwarf_Unsigned * dw_section_offset,
    Dwarf_Error * dw_error )
```

Given a section index, get its size and address, etc.

See [dwarf\\_get\\_section\\_info\\_by\\_index\(\)](#) for the older and still current version.

Any of the pointers `dw_section_addr`, `dw_section_size`, `dw_section_flags`, and `dw_section_offset` may be passed in as zero and those will be ignored by the function.

#### Parameters

<code>dw_dbg</code>	The Dwarf_Debug of interest.
---------------------	------------------------------

## Parameters

<i>dw_section_index</i>	Pass in an index, 0 through N-1 where N is the count returned from <code>dwarf_get_section_count</code> . As an index type <code>-int-</code> works in practice, but should really be <code>Dwarf_Unsigned</code> .
<i>dw_section_name</i>	On success returns a pointer to the section name as it appears in the object file.
<i>dw_section_addr</i>	On success returns the section address as defined by an object header.
<i>dw_section_size</i>	On success returns the section size as defined by an object header.
<i>dw_section_flags</i>	On success returns the section flags as defined by an object header. The flag meaning depends on which object format is being read and the meaning is defined by the object format. In PE object files this field is called <b>Characteristics</b> . We hope it is of some use.
<i>dw_section_offset</i>	On success returns the section offset as defined by an object header. The offset meaning is supposedly an object file offset but the meaning depends on the object file type(!). We hope it is of some use.
<i>dw_error</i>	On error returns the usual error pointer.

## Returns

Returns `DW_DLV_OK` etc.

9.34.2.12 `dwarf_get_section_info_by_name()`

```
DW_API int dwarf_get_section_info_by_name (
    Dwarf_Debug dw_dbg,
    const char * dw_section_name,
    Dwarf_Addr * dw_section_addr,
    Dwarf_Unsigned * dw_section_size,
    Dwarf_Error * dw_error )
```

Given a section name, get its size and address.

See [dwarf\\_get\\_section\\_info\\_by\\_name\\_a\(\)](#) for the newest version which returns additional values.

Fields and meanings in [dwarf\\_get\\_section\\_info\\_by\\_name\(\)](#) are the same as in [dwarf\\_get\\_section\\_info\\_by\\_name\\_a\(\)](#) except that the arguments `dw_section_flags` and `dw_section_offset` are missing here.

9.34.2.13 `dwarf_get_section_info_by_name_a()`

```
DW_API int dwarf_get_section_info_by_name_a (
    Dwarf_Debug dw_dbg,
    const char * dw_section_name,
    Dwarf_Addr * dw_section_addr,
    Dwarf_Unsigned * dw_section_size,
    Dwarf_Unsigned * dw_section_flags,
    Dwarf_Unsigned * dw_section_offset,
    Dwarf_Error * dw_error )
```

Given a section name, get its size, address, etc.

New in v0.9.0 November 2023.

This is not often used and is completely unnecessary for most to call.

See [dwarf\\_get\\_section\\_info\\_by\\_name\(\)](#) for the older and still current version.

Any of the pointers `dw_section_addr`, `dw_section_size`, `dw_section_flags`, and `dw_section_offset` may be passed in as zero and those will be ignored by the function.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_section_name</i>	Pass in a pointer to a section name. It must be an exact match to the real section name.
<i>dw_section_addr</i>	On success returns the section address as defined by an object header.
<i>dw_section_size</i>	On success returns the section size as defined by an object header.
<i>dw_section_flags</i>	On success returns the section flags as defined by an object header. The flag meaning depends on which object format is being read and the meaning is defined by the object format. We hope it is of some use. In PE object files this field is called <b>Characteristics</b> .
<i>dw_section_offset</i>	On success returns the section offset as defined by an object header. The offset meaning is supposedly an object file offset but the meaning depends on the object file type(!). We hope it is of some use.
<i>dw_error</i>	On error returns the usual error pointer.

## Returns

Returns DW\_DLV\_OK etc.

## 9.34.2.14 dwarf\_get\_section\_max\_offsets\_d()

```
DW_API int dwarf_get_section_max_offsets_d (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned * dw_debug_info_size,
    Dwarf_Unsigned * dw_debug_abbrev_size,
    Dwarf_Unsigned * dw_debug_line_size,
    Dwarf_Unsigned * dw_debug_loc_size,
    Dwarf_Unsigned * dw_debug_aranges_size,
    Dwarf_Unsigned * dw_debug_macinfo_size,
    Dwarf_Unsigned * dw_debug_pubnames_size,
    Dwarf_Unsigned * dw_debug_str_size,
    Dwarf_Unsigned * dw_debug_frame_size,
    Dwarf_Unsigned * dw_debug_ranges_size,
    Dwarf_Unsigned * dw_debug_pubtypes_size,
    Dwarf_Unsigned * dw_debug_types_size,
    Dwarf_Unsigned * dw_debug_macro_size,
    Dwarf_Unsigned * dw_debug_str_offsets_size,
    Dwarf_Unsigned * dw_debug_sup_size,
    Dwarf_Unsigned * dw_debug_cu_index_size,
    Dwarf_Unsigned * dw_debug_tu_index_size,
    Dwarf_Unsigned * dw_debug_names_size,
    Dwarf_Unsigned * dw_debug_loclists_size,
    Dwarf_Unsigned * dw_debug_rnglists_size )
```

Get section sizes for many sections.

The list of sections is incomplete and the argument list is ... too long ... making this an unusual function

Originally a hack so clients could verify offsets. Added so that one can detect broken offsets (which happened in an IRIX executable larger than 2GB with MIPSpro 7.3.1.3 toolchain.).

## Parameters

<i>dw_dbg</i>	Pass in a valid Dwarf_Debug of interest.
---------------	--

**Returns**

If the `dw_dbg` is non-null it returns `DW_DLV_OK`. If `dw_dbg` is NULL it returns `DW_DLV_NO_ENTRY`.

**9.34.2.15 dwarf\_machine\_architecture()**

```
DW_API int dwarf_machine_architecture (
    Dwarf_Debug dw_dbg,
    Dwarf_Small * dw_ftype,
    Dwarf_Small * dw_obj_pointersize,
    Dwarf_Bool * dw_obj_is_big_endian,
    Dwarf_Unsigned * dw_obj_machine,
    Dwarf_Unsigned * dw_obj_flags,
    Dwarf_Small * dw_path_source,
    Dwarf_Unsigned * dw_ub_offset,
    Dwarf_Unsigned * dw_ub_count,
    Dwarf_Unsigned * dw_ub_index,
    Dwarf_Unsigned * dw_comdat_groupnumber )
```

Get basic object information original version.

Identical to `dwarf_machine_architecture_a()` except that this older version does not have the `dw_obj_type` argument so it cannot return the Elf `e_type` value..

**9.34.2.16 dwarf\_machine\_architecture\_a()**

```
DW_API int dwarf_machine_architecture_a (
    Dwarf_Debug dw_dbg,
    Dwarf_Small * dw_ftype,
    Dwarf_Small * dw_obj_pointersize,
    Dwarf_Bool * dw_obj_is_big_endian,
    Dwarf_Unsigned * dw_obj_machine,
    Dwarf_Unsigned * dw_obj_type,
    Dwarf_Unsigned * dw_obj_flags,
    Dwarf_Small * dw_path_source,
    Dwarf_Unsigned * dw_ub_offset,
    Dwarf_Unsigned * dw_ub_count,
    Dwarf_Unsigned * dw_ub_index,
    Dwarf_Unsigned * dw_comdat_groupnumber )
```

Get basic object information from `Dwarf_Debug`.

Not all the fields here are relevant for all object types, and the `dw_obj_machine` and `dw_obj_flags` have ABI-defined values which have nothing to do with DWARF.

This version added December 2024 with an additional argument: `dw_obj_type`.

`dw_ub_offset`, `dw_ub_count`, `dw_ub_index` only apply to `DW_FTYPE_APPLEUNIVERSAL`.

`dw_comdat_groupnumber` only applies to `DW_FTYPE_ELF`.

Other than `dw_dbg` one can pass in NULL for any pointer parameter whose value is not of interest.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_ftype</i>	Pass in a pointer. On success the value pointed to will be set to the applicable DW_FTYPE value (see <a href="#">libdwwarf.h</a> ).
<i>dw_obj_pointersize</i>	Pass in a pointer. On success the value pointed to will be set to the applicable pointer size, which is almost always either 4 or 8.
<i>dw_obj_is_big_endian</i>	Pass in a pointer. On success the value pointed to will be set to either 1 (the object being read is big-endian) or 0 (the object being read is little-endian).
<i>dw_obj_machine</i>	Pass in a pointer. On success the value pointed to will be set to a value that the specific ABI uses for the machine-architecture the object file says it is for.
<i>dw_obj_type</i>	Pass in a pointer. On success the value pointed to will be set to a value that the specific ABI uses for the machine-architecture the object file says it is for (for ELF is elf header e_type).
<i>dw_obj_flags</i>	Pass in a pointer. On success the value pointed to will be set to a value that the specific ABI uses for a header record flags word (in a PE object the flags word is called <b>Characteristics</b> ).
<i>dw_path_source</i>	Pass in a pointer. On success the value pointed to will be set to a value that libdwwarf sets to a DW_PATHSOURCE value indicating what caused the file path.
<i>dw_ub_offset</i>	Pass in a pointer. On success if the value of dw_ftype is DW_FTYPE_APPLEUNIVERSAL the returned value will be set to the count (in all other cases, the value is set to 0)
<i>dw_ub_count</i>	Pass in a pointer. On success if the value of dw_ftype is DW_FTYPE_APPLEUNIVERSAL the returned value will be set to the number of object files in the binary (in all other cases, the value is set to 0)
<i>dw_ub_index</i>	Pass in a pointer. On success if the value of dw_ftype is DW_FTYPE_APPLEUNIVERSAL the returned value will be set to the number of the specific object from the universal-binary, usable values are 0 through dw_ub_count-1. (in all other cases, the value is set to 0)
<i>dw_comdat_groupnumber</i>	Pass in a pointer. On success if the value of dw_ftype is DW_FTYPE_ELF the returned value will be the comdat group being referenced. (in all other cases, the value is set to 0)

## Returns

Returns DW\_DLV\_NO\_ENTRY if the Dwarf\_Debug passed in is null or stale. Otherwise returns DW\_DLV\_OK and non-null return-value pointers will have meaningful data.

## 9.35 Section Groups Objectfile Data

## Functions

- DW\_API int [dwarf\\_sec\\_group\\_sizes](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Unsigned \*dw\_section\_count\_out, Dwarf\_Unsigned \*dw\_group\_count\_out, Dwarf\_Unsigned \*dw\_selected\_group\_out, Dwarf\_Unsigned \*dw\_map\_entry\_count\_out, Dwarf\_Error \*dw\_error)

*Get Section Groups data counts.*

- DW\_API int [dwarf\\_sec\\_group\\_map](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Unsigned dw\_map\_entry\_count, Dwarf\_Unsigned \*dw\_group\_numbers\_array, Dwarf\_Unsigned \*dw\_sec\_numbers\_array, const char \*\*dw\_sec\_names\_array, Dwarf\_Error \*dw\_error)

*Return a map between group numbers and section numbers.*

### 9.35.1 Detailed Description

Section Groups are defined in the extended Elf ABI and are seen in relocatable Elf object files, not executables or shared objects.

[Section Groups Overview](#)

### 9.35.2 Function Documentation

#### 9.35.2.1 dwarf\_sec\_group\_map()

```
DW_API int dwarf_sec_group_map (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned dw_map_entry_count,
    Dwarf_Unsigned * dw_group_numbers_array,
    Dwarf_Unsigned * dw_sec_numbers_array,
    const char ** dw_sec_names_array,
    Dwarf_Error * dw_error )
```

Return a map between group numbers and section numbers.

This map shows all the groups in the object file and shows which object sections go with which group.

#### Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_map_entry_count</i>	Pass in the dw_map_entry_count_out from dwarf_sec_group_sizes
<i>dw_group_numbers_array</i>	Pass in an array of Dwarf_Unsigned with dw_map_entry_count entries. Zero the data before the call here. On success returns a list of group numbers.
<i>dw_sec_numbers_array</i>	Pass in an array of Dwarf_Unsigned with dw_map_entry_count entries. Zero the data before the call here. On success returns a list of section numbers.
<i>dw_sec_names_array</i>	Pass in an array of const char * with dw_map_entry_count entries. Zero the data before the call here. On success returns a list of section names.
<i>dw_error</i>	The usual error details pointer.

#### Returns

On success returns DW\_DLV\_OK

#### 9.35.2.2 dwarf\_sec\_group\_sizes()

```
DW_API int dwarf_sec_group_sizes (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned * dw_section_count_out,
    Dwarf_Unsigned * dw_group_count_out,
    Dwarf_Unsigned * dw_selected_group_out,
    Dwarf_Unsigned * dw_map_entry_count_out,
    Dwarf_Error * dw_error )
```

Get Section Groups data counts.

Allows callers to find out what groups (dwo or COMDAT) are in the object and how much to allocate so one can get the group-section map data.

This is relevant for Debug Fission. If an object file has both .dwo sections and non-dwo sections or it has Elf COMDAT GROUP sections this becomes important.

### Section Groups Overview

#### Parameters

<i>dw_dbg</i>	Pass in the Dwarf_Debug of interest.
<i>dw_section_count_out</i>	On success returns the number of DWARF sections in the object file. Can sometimes be many more than are of interest.
<i>dw_group_count_out</i>	On success returns the number of groups. Though usually one, it can be much larger.
<i>dw_selected_group_out</i>	On success returns the groupnumber that applies to this specific open Dwarf_Debug.
<i>dw_map_entry_count_out</i>	On success returns the count of record allocations needed to call dwarf_sec_group_map successfully. dw_map_entry_count_out will be less than or equal to dw_section_count_out.
<i>dw_error</i>	The usual error details pointer.

#### Returns

On success returns DW\_DLV\_OK

## 9.36 LEB Encode and Decode

### Functions

- DW\_API int **dwarf\_encode\_leb128** ([Dwarf\\_Unsigned](#) dw\_val, int \*dw\_nbytes, char \*dw\_space, int dw\_splen)
- DW\_API int **dwarf\_encode\_signed\_leb128** ([Dwarf\\_Signed](#) dw\_val, int \*dw\_nbytes, char \*dw\_space, int dw\_splen)
- DW\_API int **dwarf\_decode\_leb128** (char \*dw\_leb, [Dwarf\\_Unsigned](#) \*dw\_leblen, [Dwarf\\_Unsigned](#) \*dw\_outval, char \*dw\_endptr)
- DW\_API int **dwarf\_decode\_signed\_leb128** (char \*dw\_leb, [Dwarf\\_Unsigned](#) \*dw\_leblen, [Dwarf\\_Signed](#) \*dw\_outval, char \*dw\_endptr)

### 9.36.1 Detailed Description

These are LEB/ULEB reading and writing functions heavily used inside libdwarf.

While the DWARF Standard does not mention allowing extra insignificant trailing bytes in a ULEB these functions allow a few such for compilers using extras for alignment in DWARF.

## 9.37 Miscellaneous Functions

### Functions

- DW\_API const char \* [dwarf\\_package\\_version](#) (void)  
*Return the version string in the library.*
- DW\_API int [dwarf\\_set\\_stringcheck](#) (int dw\_stringcheck)  
*Turn off libdwarf checks of strings.*
- DW\_API int [dwarf\\_set\\_reloc\\_application](#) (int dw\_apply)  
*Set libdwarf response to \*.rela relocations.*
- DW\_API void [dwarf\\_record\\_cmdline\\_options](#) (Dwarf\_Cmdline\_Options dw\_dd\_options)  
*Tell libdwarf to add verbosity to Line Header errors By default the flag in the struct argument is zero. dwarfdump uses this when -v used on dwarfdump.*
- DW\_API int [dwarf\\_set\\_de\\_alloc\\_flag](#) (int dw\_v)  
*Eliminate libdwarf tracking of allocations Independent of any Dwarf\_Debug and applicable to all whenever the setting is changed. Defaults to non-zero.*
- DW\_API int [dwarf\\_library\\_allow\\_dup\\_attr](#) (int dw\_v)  
*Eliminate libdwarf checking attribute duplication.*
- DW\_API Dwarf\_Small [dwarf\\_set\\_default\\_address\\_size](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Small dw\_value)  
*Set the address size on a Dwarf\_Debug.*
- DW\_API int [dwarf\\_get\\_universalbinary\\_count](#) (Dwarf\_Debug dw\_dbg, Dwarf\_Unsigned \*dw\_current\_index, Dwarf\_Unsigned \*dw\_available\_count)  
*Retrieve universal binary index.*

### Variables

- DW\_API void(\*) (void \*, const void \*, unsigned long) [dwarf\\_get\\_endian\\_copy\\_function](#) (Dwarf\_Debug dw\_dbg)  
*Get a pointer to the applicable swap/noswap function.*
- DW\_API Dwarf\_Cmdline\_Options [dwarf\\_cmdline\\_options](#)

### 9.37.1 Detailed Description

### 9.37.2 Function Documentation

#### 9.37.2.1 dwarf\_get\_universalbinary\_count()

```
DW_API int dwarf_get_universalbinary_count (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned * dw_current_index,
    Dwarf_Unsigned * dw_available_count )
```

Retrieve universal binary index.

For Mach-O universal binaries this returns relevant information.

For non-universal binaries (Mach-O, Elf, or PE) the values are not meaningful, so the function returns DW\_DLV\_NO\_ENTRY..

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_current_index</i>	If dw_current_index is passed in non-null the function returns the universal-binary index of the current object (which came from a universal binary).
<i>dw_available_count</i>	If dw_current_index is passed in non-null the function returns the count of binaries in the universal binary.

## Returns

Returns DW\_DLV\_NO\_ENTRY if the object file is not from a Mach-O universal binary. Returns DW\_DLV\_↵ NO\_ENTRY if dw\_dbg is passed in NULL. Never returns DW\_DLV\_ERROR.

## 9.37.2.2 dwarf\_library\_allow\_dup\_attr()

```
DW_API int dwarf_library_allow_dup_attr (
    int dw_v )
```

Eliminate libdwf checking attribute duplication.

Independent of any Dwarf\_Debug, this sets a global flag in libdwf and is applicable to all whenever the setting is changed. Defaults to zero so by default libdwf does check every set of abbreviations for duplicate attributes.

DWARF5 Sec 2.2 Attribute Types Each attribute value is characterized by an attribute name. No more than one attribute with a given name may appear in any debugging information entry. Essentially the same wording is in Sec 2.2 of DWARF2, DWARF3 and DWARF4.

Do not call this with non-zero dw\_v unless you really want the library to avoid this basic DWARF-correctness check.

## Since

{0.12.0}

## Parameters

<i>dw_↵_v</i>	If non-zero passed in libdwf will avoid the checks and will not return errors for an abbreviation list with duplicate attributes.
---------------	---

## Returns

Returns the previous version of the flag.

## 9.37.2.3 dwarf\_package\_version()

```
DW_API const char * dwarf_package_version (
    void )
```

Return the version string in the library.

An example: "0.3.0" which is a Semantic Version identifier. Before September 2021 the version string was a date, for example "20210528", which is in ISO date format. See DW\_LIBDWARF\_VERSION DW\_LIBDWARF\_VERSION\_↵\_MAJOR DW\_LIBDWARF\_VERSION\_MINOR DW\_LIBDWARF\_VERSION\_MICRO

**Returns**

The Package Version built into libdwarf.so or libdwarf.a

**9.37.2.4 dwarf\_record\_cmdline\_options()**

```
DW_API void dwarf_record_cmdline_options (
    Dwarf_Cmdline_Options dw_dd_options )
```

Tell libdwarf to add verbosity to Line Header errors By default the flag in the struct argument is zero. dwarfdump uses this when -v used on dwarfdump.

**See also**

[dwarf\\_register\\_printf\\_callback](#)

**Parameters**

<i>dw_dd_options</i>	The structure has one flag, and if the flag is nonzero and there is an error in reading a line table header the function passes back detail error messages via <a href="#">dwarf_register_printf_callback</a> .
----------------------	---

**9.37.2.5 dwarf\_set\_de\_alloc\_flag()**

```
DW_API int dwarf_set_de_alloc_flag (
    int dw_v )
```

Eliminate libdwarf tracking of allocations Independent of any Dwarf\_Debug and applicable to all whenever the setting is changed. Defaults to non-zero.

**Parameters**

<i>dw↔ _v</i>	If zero passed in libdwarf will run somewhat faster and library memory allocations will not all be tracked and <a href="#">dwarf_finish()</a> will be unable to free/dealloc some things. User code can do the necessary deallocs (as documented), but the normal guarantee that libdwarf will clean up is revoked. If non-zero passed in libdwarf will resume or continue tracking allocations
-------------------	---

**Returns**

Returns the previous version of the flag.

**9.37.2.6 dwarf\_set\_default\_address\_size()**

```
DW_API Dwarf_Small dwarf_set_default_address_size (
    Dwarf_Debug dw_dbg,
    Dwarf_Small dw_value )
```

Set the address size on a Dwarf\_Debug.

DWARF information CUs and other section DWARF headers define a CU-specific address size, but this Dwarf\_↔ Debug value is used when other address size information does not exist, for example in a DWARF2 CIE or FDE.

## Parameters

<i>dw_dbg</i>	The Dwarf_Debug of interest.
<i>dw_value</i>	Sets the address size for the Dwarf_Debug to a non-zero value. The default address size is derived from headers in the object file. Values larger than the size of Dwarf_Addr are not set. If zero passed the default is not changed.

## Returns

Returns the last set address size.

**9.37.2.7 dwarf\_set\_reloc\_application()**

```
DW_API int dwarf_set_reloc_application (
    int dw_apply )
```

Set libdwarf response to \*.rela relocations.

*dw\_apply* defaults to 1 and means apply all '.rela' relocations on reading in a dwarf object section of such relocations. Best to just ignore this function It applies to all Dwarf\_Debug open and all opened later in this library instance.

## Parameters

<i>dw_apply</i>	Pass in a zero to turn off reading and applying of .rela relocations, which will likely break reading of .o object files but probably will not break reading executables or shared objects. Pass in non zero (it is really just an 8 bit value, so use a small value) to turn off inspecting .rela sections.
-----------------	--

## Returns

Returns the previous value of the apply flag.

**9.37.2.8 dwarf\_set\_stringcheck()**

```
DW_API int dwarf_set_stringcheck (
    int dw_stringcheck )
```

Turn off libdwarf checks of strings.

Zero is the default and means do all string length validity checks. It applies to all Dwarf\_Debug open and all opened later in this library instance.

## Parameters

<i>dw_stringcheck</i>	Pass in a small non-zero value to turn off all libdwarf string validity checks. It speeds up libdwarf, but...is dangerous and voids all promises the library will not segfault.
-----------------------	---

**Returns**

Returns the previous value of this flag.

**9.37.3 Variable Documentation****9.37.3.1 dwarf\_get\_endian\_copy\_function**

```
DW_API void(*) (void *, const void *, unsigned long) dwarf_get_endian_copy_function(Dwarf_Debug
dw_dbg) (
    Dwarf_Debug dw_dbg )
```

Get a pointer to the applicable swap/noswap function.

the function pointer returned enables libdwarf users to use the same 64bit/32bit/16bit word copy as libdwarf does internally for the Dwarf\_Debug passed in. The function makes it possible for libdwarf to read either endianness.

**Parameters**

<i>dw_dbg</i>	Pass in a pointer to the applicable Dwarf_Debug.
---------------	--

**Returns**

a pointer to a copy function. If the object file referred to and the libdwarf reading that file are the same endianness the function returned will, when called, do a simple memcpy, effectively, while otherwise it would do a byte-swapping copy. It seems unlikely this will be useful to most library users. To call the copy function returned the first argument must be a pointer to the target word and the second must be a pointer to the input word. The third argument is the length to be copied and it must be 2,4,or 8.

**9.38 Determine Object Type of a File****Functions**

- DW\_API int **dwarf\_object\_detector\_path\_b** (const char \*dw\_path, char \*dw\_outpath\_buffer, unsigned long dw\_outpathlen, char \*\*dw\_gl\_pathnames, unsigned int dw\_gl\_pathcount, unsigned int \*dw\_ftype, unsigned int \*dw\_endian, unsigned int \*dw\_offsetsize, Dwarf\_Unsigned \*dw\_filesize, unsigned char \*dw\_pathsource, int \*dw\_errcode)
- DW\_API int **dwarf\_object\_detector\_path\_dSYM** (const char \*dw\_path, char \*dw\_outpath, unsigned long dw\_outpath\_len, char \*\*dw\_gl\_pathnames, unsigned int dw\_gl\_pathcount, unsigned int \*dw\_ftype, unsigned int \*dw\_endian, unsigned int \*dw\_offsetsize, Dwarf\_Unsigned \*dw\_filesize, unsigned char \*dw\_pathsource, int \*dw\_errcode)
- DW\_API int **dwarf\_object\_detector\_fd** (int dw\_fd, unsigned int \*dw\_ftype, unsigned int \*dw\_endian, unsigned int \*dw\_offsetsize, Dwarf\_Unsigned \*dw\_filesize, int \*dw\_errcode)

**9.38.1 Detailed Description**

This group of functions are unlikely to be called by your code unless your code needs to know the basic data about an object file without actually opening a Dwarf\_Debug.

These are crucial for libdwarf itself. The dw\_ftype returned is one of DW\_FTYPE\_ELF, DW\_FTYPE\_PE, DW\_FTYPE\_MACH\_O, or DW\_FTYPE\_APPLEUNIVERSAL.

These are not meant to deal with a specific binary inside a MacOS Universal Binary (DW\_FTYPE\_APPLEUNIVERSAL).

## 9.39 Section allocation: malloc or mmap

### Functions

- DW\_API enum [Dwarf\\_Sec\\_Alloc\\_Pref](#) [dwarf\\_set\\_load\\_preference](#) (enum [Dwarf\\_Sec\\_Alloc\\_Pref](#) [dw\\_load\\_preference](#))  
*Set/Retrieve section allocation preference.*
- DW\_API int [dwarf\\_get\\_mmap\\_count](#) ([Dwarf\\_Debug](#) [dw\\_dbg](#), [Dwarf\\_Unsigned](#) \*[dw\\_mmap\\_count](#), [Dwarf\\_Unsigned](#) \*[dw\\_mmap\\_size](#), [Dwarf\\_Unsigned](#) \*[dw\\_malloc\\_count](#), [Dwarf\\_Unsigned](#) \*[dw\\_malloc\\_size](#))  
*Retrieve count of mmap/malloc sections.*

### 9.39.1 Detailed Description

Functions related to the choice of malloc/read or mmap for object section memory allocation.

The default allocation preference is malloc().

The shell environment variable DWARF\_WHICH\_ALLOC is also involved at runtime but it only applies to reading Elf object files.. If the value is 'malloc' then use of read/malloc is preferred. If the value is 'mmap' then use of mmap is preferred (Example: 'export DWARF\_WHICH\_ALLOC=mmap'). Otherwise, the environment value is checked and ignored.

If present and valid this environment variable takes precedence over [dwarf\\_set\\_load\\_preference\(\)](#).

### 9.39.2 Function Documentation

#### 9.39.2.1 dwarf\_get\_mmap\_count()

```
DW_API int dwarf_get_mmap_count (
    Dwarf_Debug dw_dbg,
    Dwarf_Unsigned * dw_mmap_count,
    Dwarf_Unsigned * dw_mmap_size,
    Dwarf_Unsigned * dw_malloc_count,
    Dwarf_Unsigned * dw_malloc_size )
```

Retrieve count of mmap/malloc sections.

Since

{0.12.0}

Note that compressed section contents will be expanded into a malloc/read section in all cases.

#### Parameters

<i>dw_dbg</i>	A valid open Dwarf_Debug.
<i>dw_mmap_count</i>	On success the number of sections allocated with mmap is returned. If null passed in the argument is ignored.
<i>dw_mmap_size</i>	On success the size total in bytes of sections allocated with mmap is returned. If null passed in the argument is ignored.
<i>dw_malloc_count</i>	On success the number of sections read/allocated with read/malloc is returned. If null passed in the argument is ignored. On success the number of sections allocated with malloc/read is returned.
<i>dw_malloc_size</i>	On success the total size in bytes of sections with malloc/read is returned. If null passed in the argument is ignored. On success the number of sections read/allocated with

**Returns**

On success returns DW\_DLV\_OK and sets the counts and total size through the respective non-null pointer arguments. If dw\_dbg is invalid or NULL the function returns DW\_DLV\_ERROR. Never returns DW\_DLV\_↔NO\_ENTRY.

**9.39.2.2 dwarf\_set\_load\_preference()**

```
DW_API enum Dwarf_Sec_Alloc_Pref dwarf_set_load_preference (
    enum Dwarf_Sec_Alloc_Pref dw_load_preference )
```

Set/Retrieve section allocation preference.

**Since**

{0.12.0}

By default object file sections are loaded using malloc and read (Dwarf\_Alloc\_Malloc). This works everywhere and works well on all but gigantic object files.

The preference of Dwarf\_Alloc\_Mmap does not guarantee mmap will be used for object section data, but does cause mmap() to be used when possible.

In 0.12.0 mmap() is only usable on Elf object files.

dw\_load\_preference is one of Dwarf\_Alloc\_Malloc (1) Dwarf\_Alloc\_Mmap (2)

Must be called before calling a dwarf\_init\*() to be effective in a dwarf\_init\*(). The value is remembered for subsequent dwarf\_init\*() in the library runtime being executed.

**Parameters**

<i>dw_load_preference</i>	If passed in Dwarf_Alloc_Mmap then future calls to any dwarf_init*() function will use mmap to load object sections if possible. If passed in Dwarf_Alloc_Malloc then future calls to any dwarf_init*() function will use mmap to load sections. Any other value passed in dw_load_preference is ignored.
---------------------------	---

**Returns**

Always returns the value before dw\_load\_preference applied, of this runtime global preference.

**9.40 Using dwarf\_init\_path()**

Example of a libdwarf initialization call.

Example of a libdwarf initialization call.

An example calling dwarf\_init\_path() and dwarf\_finish()

## Parameters

<i>path</i>	Path to an object we wish to open.
<i>groupnumber</i>	Desired groupnumber. Use DW_DW_GROUPNUMBER_ANY unless you have reason to do otherwise.

## Returns

Returns the applicable result. DW\_DLV\_OK etc.

```

*/
int exampleinit(const char *path, unsigned groupnumber)
{
    static char true_pathbuf[FILENAME_MAX];
    unsigned tpathlen = FILENAME_MAX;
    Dwarf_Handler errhand = 0;
    Dwarf_Ptr errarg = 0;
    Dwarf_Error error = 0;
    Dwarf_Debug dbg = 0;
    int res = 0;

    res = dwarf_init_path(path, true_pathbuf,
        tpathlen, groupnumber, errhand,
        errarg, &dbg, &error);
    if (res == DW_DLV_ERROR) {
        /* Necessary call even though dbg is null!
           This avoids a memory leak. */
        dwarf_dealloc_error(dbg, error);
        return res;
    }
    if (res == DW_DLV_NO_ENTRY) {
        /* Nothing we can do */
        return res;
    }
    printf("The file we actually opened is %s\n",
        true_pathbuf);
    /* Call libdwarf functions here */
    dwarf_finish(dbg);
    return DW_DLV_OK;
}

```

## 9.41 Using dwarf\_init\_path\_dl()

Example focused on GNU debuglink data.

Example focused on GNU debuglink data.

In case GNU debuglink data is followed the true\_pathbuf content will not match path. The path actually used is copied to true\_path\_out.

In the case of MacOS dSYM the true\_path\_out may not match path.

If debuglink data is missing from the Elf executable or shared-object (ie, it is a normal object!) or unusable by libdwarf or true\_path\_buffer len is zero or true\_path\_out\_buffer is zero libdwarf accepts the path given as the object to report on, no debuglink or dSYM processing will be used.

## See also

<https://sourceware.org/gdb/onlinedocs/gdb/Separate-Debug-Files.html>

An example calling [dwarf\\_init\\_path\\_dl\(\)](#) and [dwarf\\_finish\(\)](#)

## Parameters

<i>path</i>	Path to an object we wish to open.
<i>groupnumber</i>	Desired groupnumber. Use DW_DW_GROUPNUMBER_ANY unless you have reason to do otherwise.
<i>error</i>	A pointer we can use to record error details.

## Returns

Returns the applicable result. DW\_DLV\_OK etc.

```

*/
int exampleinit_dl(const char *path, unsigned groupnumber,
Dwarf_Error *error)
{

```

## 9.42 Using dwarf\_attrlist()

Example showing [dwarf\\_attrlist\(\)](#)

Example showing [dwarf\\_attrlist\(\)](#)

## Parameters

<i>somedie</i>	Pass in any valid relevant DIE pointer.
<i>error</i>	An error pointer we can use.

## Returns

Return DW\_DLV\_OK (etc).

```

*/
int example1(Dwarf_Die somedie, Dwarf_Error *error)
{
    Dwarf_Debug dbg = 0;
    Dwarf_Signed atcount;
    Dwarf_Attribute *atlist;
    Dwarf_Signed i = 0;
    int errv;

    errv = dwarf_attrlist(somedie, &atlist, &atcount, error);
    if (errv != DW_DLV_OK) {
        return errv;
    }
    for (i = 0; i < atcount; ++i) {
        Dwarf_Half attrnum = 0;
        const char *attrname = 0;

        /* use atlist[i], likely calling
         libdwarf functions and likely
         returning DW_DLV_ERROR if
         what you call gets DW_DLV_ERROR */
        errv = dwarf_whatattr(atlist[i], &attrnum, error);
        if (errv != DW_DLV_OK) {
            /* Something really bad happened. */
            return errv;
        }
        dwarf_get_AT_name(attrnum, &attrname);
        printf("Attribute[%ld], value %u name %s\n",
            (long int)i, attrnum, attrname);
        dwarf_dealloc_attribute(atlist[i]);
        atlist[i] = 0;
    }
    dwarf_dealloc(dbg, atlist, DW_DLA_LIST);
    return DW_DLV_OK;
}

```

## 9.43 Attaching a tied dbg

Example attaching base dbg to a split-DWARF object.

Example attaching base dbg to a split-DWARF object.

See DWARF5 Appendix F on Split-DWARF.

By libdwarf convention, open the split Dwarf\_Debug using a dwarf\_init call. Then open the executable as the tied object. Then call [dwarf\\_set\\_tied\\_dbg\(\)](#) so the library can look for relevant data in the tied-dbg (the executable).

With split dwarf your libdwarf calls after the the initial open are done against the split Dwarf\_Dbg and libdwarf automatically looks in the tied dbg when and as appropriate. the tied\_dbg can be detached too, see [example3](#) link, though you must call [dwarf\\_finish\(\)](#) on the detached dw\_tied\_dbg, the library will not do that for you.

### Parameters

<i>split_dbg</i>	
<i>tied_dbg</i>	
<i>error</i>	

## Returns

Returns DW\_DLV\_OK or DW\_DLV\_ERROR or DW\_DLV\_NO\_ENTRY to the caller.

```

*/
int example2(Dwarf_Debug split_dbg, Dwarf_Debug tied_dbg,
    Dwarf_Error *error)

```

```

{
    int res = 0;

    /* The caller should have opened dbg
       on the split-dwarf object/dwp,
       an object with DWARF, but no executable
       code.
       And it should have opened tieddbg on the
       runnable shared object or executable. */
    res = dwarf_set_tied_dbg(split_dbg,tied_dbg,error);
    /* Let the caller (who initialized the dbg
       values) deal with doing dwarf_finish()
       /
    return res;
}

```

## 9.44 Detaching a tied dbg

Example detaching a tied (executable) dbg.

Example detaching a tied (executable) dbg.

See DWARF5 Appendix F on Split-DWARF.

With split dwarf your libdwarf calls after than the initial open are done against the split Dwarf\_Dbg and libdwarf automatically looks in the open tied dbg when and as appropriate. the tied-dbg can be detached too, see example3 link, though you must call [dwarf\\_finish\(\)](#) on the detached dw\_tied\_dbg, the library will not do that for you..

```

*/
int example3(Dwarf_Debug split_dbg,Dwarf_Error *error)
{
    int res = 0;
    res = dwarf_set_tied_dbg(split_dbg,NULL,error);
    if (res != DW_DLV_OK) {
        /* Something went wrong*/
        return res;
    }
    return res;
}

```

## 9.45 Examining Section Group data

Example accessing Section Group data.

Example accessing Section Group data.

With split dwarf your libdwarf calls after than the initial open are done against the base Dwarf\_Dbg and libdwarf automatically looks in the open tied dbg when and as appropriate. the tied-dbg can be detached too, see example3 link, though you must call [dwarf\\_finish\(\)](#) on the detached dw\_tied\_dbg, the library will not do that for you..

Section groups apply to Elf COMDAT groups too.

```

*/
void examplesecgroup(Dwarf_Debug dbg)
{
    int res = 0;
    Dwarf_Unsigned section_count = 0;
    Dwarf_Unsigned group_count;
    Dwarf_Unsigned selected_group = 0;
    Dwarf_Unsigned group_map_entry_count = 0;
    Dwarf_Unsigned *sec_nums = 0;
    Dwarf_Unsigned *group_nums = 0;
    const char ** sec_names = 0;
    Dwarf_Error error = 0;
    Dwarf_Unsigned i = 0;

    res = dwarf_sec_group_sizes(dbg,&section_count,
        &group_count,&selected_group, &group_map_entry_count,
        &error);
    if (res != DW_DLV_OK) {

```

```

        /* Something is badly wrong*/
        return;
    }
    /* In an object without split-dwarf sections
    or COMDAT sections we now have
    selected_group == 1. */
    sec_nums = calloc(group_map_entry_count, sizeof(Dwarf_Unsigned));
    if (!sec_nums) {
        /* FAIL. out of memory */
        return;
    }
    group_nums = calloc(group_map_entry_count, sizeof(Dwarf_Unsigned));
    if (!group_nums) {
        free(group_nums);
        /* FAIL. out of memory */
        return;
    }
    sec_names = calloc(group_map_entry_count, sizeof(char*));
    if (!sec_names) {
        free(group_nums);
        free(sec_nums);
        /* FAIL. out of memory */
        return;
    }

    res = dwarf_sec_group_map(dbg, group_map_entry_count,
                             group_nums, sec_nums, sec_names, &error);
    if (res != DW_DLV_OK) {
        /* FAIL. Something badly wrong. */
        free(sec_names);
        free(group_nums);
        free(sec_nums);
    }
    for (i = 0; i < group_map_entry_count; ++i) {
        /* Now do something with
        group_nums[i], sec_nums[i], sec_names[i] */
    }
    /* The strings are in Elf data.
    Do not free() the strings themselves.*/
    free(sec_names);
    free(group_nums);
    free(sec_nums);
}

```

## 9.46 Using dwarf\_siblingof\_c()

Example accessing a DIE sibling.

Example accessing a DIE sibling.

Access to each DIE on a sibling list. This is the preferred form as it is slightly more efficient than [dwarf\\_siblingof\\_b\(\)](#).

```

*/
int example4c(Dwarf_Die in_die,
             Dwarf_Error *error)
{
    Dwarf_Die return_sib = 0;
    int res = 0;

    /* in_die must be a valid Dwarf_Die */
    res = dwarf_siblingof_c(in_die, &return_sib, error);
    if (res == DW_DLV_OK) {
        /* Use return_sib here. */
        dwarf_dealloc_die(return_sib);
        /* return_sib is no longer usable for anything, we
        ensure we do not use it accidentally with: */
        return_sib = 0;
        return res;
    }
    return res;
}

```

## 9.47 Using dwarf\_siblingof\_b()

Example accessing a DIE sibling.

Example accessing a DIE sibling.

Access to each DIE on a sibling list This is the older form, required after `dwarf_next_cu_header_d()`.

Better to use `dwarf_next_cu_header_e()` and `dwarf_siblingof_c()`.

```

*/
int example4b(Dwarf_Debug dbg, Dwarf_Die in_die,
             Dwarf_Bool is_info,
             Dwarf_Error *error)
{
    Dwarf_Die return_sib = 0;
    int res = 0;

    /* in_die might be NULL following a call
       to dwarf_next_cu_header_d()
       or a valid Dwarf_Die */
    res = dwarf_siblingof_b(dbg, in_die, is_info, &return_sib, error);
    if (res == DW_DLV_OK) {
        /* Use return_sib here. */
        dwarf_dealloc_die(return_sib);
        /* return_sib is no longer usable for anything, we
           ensure we do not use it accidentally with: */
        return_sib = 0;
        return res;
    }
    return res;
}

```

## 9.48 Using dwarf\_child()

Example accessing a DIE child.

Example accessing a DIE child.

If the DIE has children (for example inner scopes in a function or members of a struct) this retrieves the DIE which appears first. The child itself may have its own sibling chain.

```

*/
void example5(Dwarf_Die in_die)
{
    Dwarf_Die return_kid = 0;
    Dwarf_Error error = 0;
    int res = 0;

    res = dwarf_child(in_die, &return_kid, &error);
    if (res == DW_DLV_OK) {
        /* Use return_kid here. */
        dwarf_dealloc_die(return_kid);
        /* The original form of dealloc still works
           dwarf_dealloc(dbg, return_kid, DW_DLA_DIE);
           /
        /* return_kid is no longer usable for anything, we
           ensure we do not use it accidentally with: */
        return_kid = 0;
    }
}

```

## 9.49 using dwarf\_validate\_die\_sibling

Example of a DIE tree validation.

Example of a DIE tree validation.

Here we show how one uses `dwarf_validate_die_sibling()`. DwarfDump uses this function as a part of its validation of DIE trees.

It is not something you need to use. But one must use it in a specific pattern for it to work properly.

`dwarf_validate_die_sibling()` depends on data set by `dwarf_child()` preceeding `dwarf_siblingof_b()` . `dwarf_child()` records a little bit of information invisibly in the Dwarf\_Debug data.

```

*/
int example_sibvalid(Dwarf_Debug dbg,
    Dwarf_Die in_die,
    Dwarf_Error*error)
{
    int      cres = DW_DLV_OK;
    int      sibres = DW_DLV_OK;
    Dwarf_Die die = 0;
    Dwarf_Die sibdie = 0;
    Dwarf_Die child = 0;
    Dwarf_Bool is_info = dwarf_get_die_infotypes_flag(die);

    die = in_die;
    for ( ; die ; die = sibdie) {
        int vres = 0;
        Dwarf_Unsigned offset = 0;

        /* Maybe print something you extract from the DIE */
        cres = dwarf_child(die,&child,error);
        if (cres == DW_DLV_ERROR) {
            if (die != in_die) {
                dwarf_dealloc_die(die);
            }
            printf("dwarf_child ERROR\n");
            return DW_DLV_ERROR;
        }
        if (cres == DW_DLV_OK) {
            int lres = 0;

            child = 0;
            lres = example_sibvalid(dbg,child,error);
            if (lres == DW_DLV_ERROR) {
                if (die != in_die) {
                    dwarf_dealloc_die(die);
                }
                dwarf_dealloc_die(child);
                printf("example_sibvalid ERROR\n");
                return lres;
            }
        }
        sibdie = 0;
        sibres = dwarf_siblingof_b(dbg,die,is_info,
            &sibdie,error);
        if (sibres == DW_DLV_ERROR) {
            if (die != in_die) {
                dwarf_dealloc_die(die);
            }
            if (child) {
                dwarf_dealloc_die(child);
            }
            printf("dwarf_siblingof_b ERROR\n");
            return DW_DLV_ERROR;
        }
        if (sibres == DW_DLV_NO_ENTRY) {
            if (die != in_die) {
                dwarf_dealloc_die(die);
            }
            if (child) {
                dwarf_dealloc_die(child);
            }
            return DW_DLV_OK;
        }
        vres = dwarf_validate_die_sibling(sibdie,&offset);
        if (vres == DW_DLV_ERROR) {
            if (die != in_die) {
                dwarf_dealloc_die(die);
            }
            if (child) {
                dwarf_dealloc_die(child);
            }
            dwarf_dealloc_die(sibdie);
            printf("Invalid sibling DIE\n");
            return DW_DLV_ERROR;
        }
        /* loop again */
        if (die != in_die) {
            dwarf_dealloc_die(die);
        }
        die = 0;
    }
    return DW_DLV_OK;
}

```

## 9.50 Example walking CUs(e)

Example examining CUs looking for specific items(e).

Example examining CUs looking for specific items(e).

Loops through as many CUs as needed, stops and returns once a CU provides the desired data.

Assumes certain functions you write to remember the aspect of CUs that matter to you so once found in a cu my\_needed\_data\_exists() or some other function of yours can identify the correct record.

Depending on your goals in examining the DIE tree it may be helpful to maintain a DIE stack of active DIEs, pushing and popping as you make your way through the DIE levels.

We assume that on a serious error we will give up (for simplicity here).

We assume the caller to examplecuhdre() will know what to retrieve (when we return DW\_DLV\_OK from examplecuhdree() and that myrecords points to a record with all the data needed by my\_needed\_data\_exists() and recorded by myrecord\_data\_for\_die().

```

*/

struct myrecords_struct *myrecords;
void myrecord_data_for_die(struct myrecords_struct *myrecords_data,
    Dwarf_Die d)
{
    /* do something */
    /* avoid compiler warnings */
    (void)myrecords_data;
    (void)d;
}
int my_needed_data_exists(struct myrecords_struct *myrecords_data)
{
    /* do something */
    /* avoid compiler warnings */
    (void)myrecords_data;
    return DW_DLV_OK;
}

/* Loop on DIE tree. */
static void
record_die_and_siblings_e(Dwarf_Debug dbg, Dwarf_Die in_die,
    int is_info, int in_level,
    struct myrecords_struct *myrec,
    Dwarf_Error *error)
{

## 9.52 Using dwarf\_offdie\_b()

Example accessing a DIE by its offset.

Example accessing a DIE by its offset.

```

/*
int example6(Dwarf_Debug dbg, Dwarf_Off die_offset,
             Dwarf_Bool is_info,
             Dwarf_Error *error)
{
    Dwarf_Die return_die = 0;
    int res = 0;

    res = dwarf_offdie_b(dbg, die_offset, is_info, &return_die, error);
    if (res != DW_DLV_OK) {
        /* res could be NO ENTRY or ERROR, so no
         * dealloc necessary. */
        return res;
    }
    /* Use return_die here. */
    dwarf_dealloc_die(return_die);
}

```

```

/* return_die is no longer usable for anything, we
   ensure we do not use it accidentally
   though a bit silly here given the return_die
   goes out of scope... */
return_die = 0;
return res;
}

```

## 9.53 Using dwarf\_offset\_given\_die()

Example finding the section offset of a DIE.

Example finding the section offset of a DIE.

Here finding the offset of a CU-DIE.

```

/*
int example7(Dwarf_Debug dbg, Dwarf_Die in_die,
             Dwarf_Bool is_info,
             Dwarf_Error * error)
{
    int res = 0;
    Dwarf_Off cudieoff = 0;
    Dwarf_Die cudie = 0;

    res = dwarf_CU_dieoffset_given_die(in_die, &cudieoff, error);
    if (res != DW_DLV_OK) {
        /* FAIL */
        return res;
    }
    res = dwarf_offdie_b(dbg, cudieoff, is_info, &cudie, error);
    if (res != DW_DLV_OK) {
        /* FAIL */
        return res;
    }
    /* do something with cu_die */
    dwarf_dealloc_die(cudie);
    return res;
}

```

## 9.54 Using dwarf\_attrlist()

Example Calling dwarf\_attrlist()

Example Calling dwarf\_attrlist()

```

/*
int example8(Dwarf_Debug dbg, Dwarf_Die somedie, Dwarf_Error *error)
{
    Dwarf_Signed atcount = 0;
    Dwarf_Attribute *atlist = 0;
    int errv = 0;
    Dwarf_Signed i = 0;

    errv = dwarf_attrlist(somedie, &atlist, &atcount, error);
    if (errv != DW_DLV_OK) {
        return errv;
    }
    for (i = 0; i < atcount; ++i) {
        /* use atlist[i] */
        dwarf_dealloc_attribute(atlist[i]);
        atlist[i] = 0;
    }
    dwarf_dealloc(dbg, atlist, DW_DLA_LIST);
    return DW_DLV_OK;
}

```

## 9.55 Using dwarf\_offset\_list()

Example using dwarf\_offset\_list.

Example using dwarf\_offset\_list.

An example calling dwarf\_offset\_list

## Parameters

<i>dbg</i>	the Dwarf_Debug of interest
<i>dieoffset</i>	The section offset of a Dwarf_Die
<i>is_info</i>	Pass in TRUE if the dieoffset is for the .debug_info section, else pass in FALSE meaning the dieoffset is for the DWARF4 .debug_types section.
<i>error</i>	The usual error detail return.

## Returns

Returns DW\_DLV\_OK etc

```

/*
int exampleoffset_list(Dwarf_Debug dbg, Dwarf_Off dieoffset,
    Dwarf_Bool is_info,Dwarf_Error * error)
{
    Dwarf_Unsigned offcnt = 0;
    Dwarf_Off *offbuf = 0;
    int errv = 0;
    Dwarf_Unsigned i = 0;

    errv = dwarf_offset_list(dbg,dieoffset, is_info,
        &offbuf,&offcnt, error);
    if (errv != DW_DLV_OK) {
        return errv;
    }
    for (i = 0; i < offcnt; ++i) {
        /* use offbuf[i] */
        /* No need to free the offbuf entry, it
           is just an offset value. */
    }
    dwarf_dealloc(dbg, offbuf, DW_DLA_LIST);
    return DW_DLV_OK;
}

```

## 9.56 Documenting Form\_Block

Example documents Form\_Block content.

Example documents Form\_Block content.

Used with certain location information functions, a frame expression function, expanded frame instructions, and DW\_FORM\_block<> functions and more.

## 9.60 Using dwarf\_srclines\_b()

Example using [dwarf\\_srclines\\_b\(\)](#)

Example using [dwarf\\_srclines\\_b\(\)](#)

An example calling dwarf\_srclines\_b

dwarf\_srclines\_dealloc\_b dwarf\_srclines\_from\_linecontext dwarf\_srclines\_files\_indexes dwarf\_srclines\_files\_↔  
data\_b dwarf\_srclines\_two\_level\_from\_linecontext

### Parameters

<i>path</i>	Path to an object we wish to open.
<i>error</i>	Allows passing back error details to the caller.

### Returns

Return DW\_DLV\_OK etc.

```

*/

        return res;
    }
    for (i = 0; i < count; ++i) {
        /* use vars[i] */
    }
    dwarf_globals_dealloc(dbg, vars, count);
    return DW_DLV_OK;
}

```

## 9.69 Reading .debug\_names data

Example access to .debug\_names.

Example access to .debug\_names.

This is accessing DWARF5 .debug\_names, a section intended to provide fast access to DIEs.

It bears a strong resemblance to what libdwarf does in dwarf\_global.c.

Making this a single (long) function here, though that is not how libdwarf or dwarfdump are written.

That is just one possible sort of access. There are many, and we would love to hear suggestions for specific new API functions in the library.

There is a wealth of information in .debug\_names and the following is all taken care of for you by [dwarf\\_get\\_globals\(\)](#).

```

*/
#define MAXPAIRS 8 /* The standard defines 5.*/
int exampledebugnames(Dwarf_Debug dbg,
    Dwarf_Unsigned *dnentrycount,
    Dwarf_Error *error)
{
    int res = DW_DLV_OK;

## 9.70 Reading .debug\_macro data (DWARF5)

Example reading DWARF5 macro data.

Example reading DWARF5 macro data.

This builds an list or some other data structure (not defined) to give an import somewhere to list the import offset and then later to enquire if the list has unexamined offsets. The code compiles but is not yet tested.

This example does not actually do the import at the correct time as this is just checking import offsets, not creating a proper full list (in the proper order) of the macros with the imports inserted. Here we find the macro context for a DIE, report those macro entries, noting any macro\_import in a list loop extracting unchecked macro offsets from the list note any import in a list Of course some functions are not implemented here...

## 9.89 Demonstrating reading DWARF without a file.

How to read DWARF2 and later from memory.

How to read DWARF2 and later from memory.

```

*/

#include <config.h>

#include <stddef.h> /* NULL */
#include <stdio.h> /* printf() */
#include <stdlib.h> /* exit() */
#include <string.h> /* strcmp() */

#include "dwarf.h"
#include "libdwarf.h"
#include "libdwarf_private.h"

/*
   This demonstrates processing DWARF
   from in_memory data. For simplicity
   in this example we are using static arrays.
   The C source is src/bin/dwarfexample/jitreader.c

   The motivation is from JIT compiling, where
   at runtime of some application, it generates
   code on the file and DWARF information for it too.

   This gives an example of enabling all of libdwarf's
   functions without actually having the DWARF information
   in a file. (If you have a file in some odd format
   you can use this approach to have libdwarf access
   the format for DWARF data and work normally without
   ever exposing the format to libdwarf.)

   None of the structures defined here in this source
   (or any source using this feature)
   are ever known to libdwarf. They are totally
   private to your code.
   The code you write (like this example) you compile
   separate from libdwarf. You never place your code
   into libdwarf, you just link your code into
   your application and link against libdwarf.

# Chapter 10

## Class Documentation

### 10.1 Dwarf\_Block\_s Struct Reference

#### Public Attributes

- [Dwarf\\_Unsigned](#) **bl\_len**
- [Dwarf\\_Ptr](#) **bl\_data**
- [Dwarf\\_Small](#) **bl\_from\_loclist**
- [Dwarf\\_Unsigned](#) **bl\_section\_offset**

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

### 10.2 Dwarf\_Cmdline\_Options\_s Struct Reference

```
#include <libdwarf.h>
```

#### Public Attributes

- [Dwarf\\_Bool](#) **check\_verbose\_mode**

#### 10.2.1 Detailed Description

`check_verbose_mode` defaults to `FALSE`. If a `libdwarf`-calling program sets this `TRUE` it means some errors in Line Table headers get a much more detailed description of the error which is reported the caller via `printf()`↵`_callback()` function (the caller can do something with the message). Or the `libdwarf` calling code can call [dwarf\\_record\\_cmdline\\_options\(\)](#) to set the new value.

For convenience the type name for the struct is `Dwarf_Cmdline_Options`.

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.3 Dwarf\_Debug\_Fission\_Per\_CU\_s Struct Reference

Collaboration diagram for Dwarf\_Debug\_Fission\_Per\_CU\_s:

### Public Attributes

- const char \* **pcu\_type**
- Dwarf\_Unsigned **pcu\_index**
- Dwarf\_Sig8 **pcu\_hash**
- Dwarf\_Unsigned **pcu\_offset** [DW\_FFISSION\_SECT\_COUNT]
- Dwarf\_Unsigned **pcu\_size** [DW\_FFISSION\_SECT\_COUNT]
- Dwarf\_Unsigned **unused1**
- Dwarf\_Unsigned **unused2**

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.4 Dwarf\_Form\_Data16\_s Struct Reference

### Public Attributes

- unsigned char **fd\_data** [16]

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.5 Dwarf\_Macro\_Details\_s Struct Reference

```
#include <libdwarf.h>
```

**Public Attributes**

- [Dwarf\\_Off](#) **dmd\_offset**
- [Dwarf\\_Small](#) **dmd\_type**
- [Dwarf\\_Signed](#) **dmd\_lineno**
- [Dwarf\\_Signed](#) **dmd\_fileindex**
- `char *` **dmd\_macro**

**10.5.1 Detailed Description**

This applies to DWARF2, DWARF3, and DWARF4 compilation units. DWARF5 `.debug_macro` has its own function interface which does not use this struct.

The documentation for this struct was generated from the following file:

- `/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h`

**10.6 Dwarf\_Obj\_Access\_Interface\_a\_s Struct Reference**

Collaboration diagram for Dwarf\_Obj\_Access\_Interface\_a\_s:

**Public Attributes**

- `void *` **ai\_object**
- `const` [Dwarf\\_Obj\\_Access\\_Methods\\_a](#) \* **ai\_methods**

The documentation for this struct was generated from the following file:

- `/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h`

**10.7 Dwarf\_Obj\_Access\_Methods\_a\_s Struct Reference**

```
#include <libdwarf.h>
```

## Public Attributes

- `int(* om_get_section_info )(void *obj, Dwarf_Unsigned section_index, Dwarf_Obj_Access_Section_a *return_section, int *error)`
- `Dwarf_Small(* om_get_byte_order )(void *obj)`
- `Dwarf_Small(* om_get_length_size )(void *obj)`
- `Dwarf_Small(* om_get_pointer_size )(void *obj)`
- `Dwarf_Unsigned(* om_get_filesize )(void *obj)`
- `Dwarf_Unsigned(* om_get_section_count )(void *obj)`
- `int(* om_load_section )(void *obj, Dwarf_Unsigned dw_section_index, Dwarf_Small **dw_return_data, int *dw_error)`
- `int(* om_relocate_a_section )(void *obj, Dwarf_Unsigned section_index, Dwarf_Debug dbg, int *error)`
- `int(* om_load_section_a )(void *obj, Dwarf_Unsigned dw_section_index, enum Dwarf_Sec_Alloc_Pref *dw_alloc_pref, Dwarf_Small **dw_return_data_ptr, Dwarf_Unsigned *dw_return_data_len, Dwarf_Small **dw_return_mmap_base_ptr, Dwarf_Unsigned *dw_return_mmap_offset, Dwarf_Unsigned *dw_return_mmap_len, int *dw_error)`
- `void(* om_finish )(void *obj)`

### 10.7.1 Detailed Description

The functions we need to access object data from libdwarf are declared here.

Unless you are reading object sections with your own code (as in [src/bin/dwarfexample/jitreader.c](#)) you will not need to fill in or use the struct.

`om_relocate_a_section` uses `malloc/read` to get section contents and returns a pointer to the malloc space through `dw_return_data`, which is recorded in the applicable section data.

`om_load_section_a` uses either `malloc/read` or `mmap` and consequently returns more data as needed for eventual `free()` or `munmap()`.

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.8 Dwarf\_Obj\_Access\_Section\_a\_s Struct Reference

### Public Attributes

- `const char * as_name`
- `Dwarf_Unsigned as_type`
- `Dwarf_Unsigned as_flags`
- `Dwarf_Addr as_addr`
- `Dwarf_Unsigned as_offset`
- `Dwarf_Unsigned as_size`
- `Dwarf_Unsigned as_link`
- `Dwarf_Unsigned as_info`
- `Dwarf_Unsigned as_addralign`
- `Dwarf_Unsigned as_entsize`

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.9 Dwarf\_Printf\_Callback\_Info\_s Struct Reference

```
#include <libdwarf.h>
```

### Public Attributes

- void \* **dp\_user\_pointer**
- [dwarf\\_printf\\_callback\\_function\\_type](#) **dp\_fptr**
- char \* **dp\_buffer**
- unsigned int **dp\_buffer\_len**
- int **dp\_buffer\_user\_provided**
- void \* **dp\_reserved**

### 10.9.1 Detailed Description

If one wishes to print detailed line table information one creates an instance of this struct and fills in the fields and passes the struct to the relevant init, for example, [dwarf\\_init\\_path\(\)](#).

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.10 Dwarf\_Ranges\_s Struct Reference

### Public Attributes

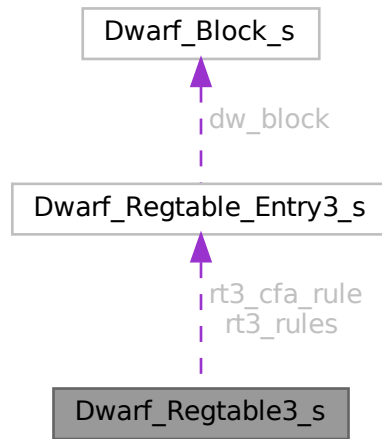

- [Dwarf\\_Addr](#) **dwr\_addr1**
- [Dwarf\\_Addr](#) **dwr\_addr2**
- enum [Dwarf\\_Ranges\\_Entry\\_Type](#) **dwr\_type**

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.11 Dwarf\_Regtable3\_s Struct Reference

Collaboration diagram for Dwarf\_Regtable3\_s:

### Public Attributes

- struct [Dwarf\\_Regtable\\_Entry3\\_s](#) `rt3_cfa_rule`
- [Dwarf\\_Half](#) `rt3_reg_table_size`
- struct [Dwarf\\_Regtable\\_Entry3\\_s](#) \* `rt3_rules`

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.12 Dwarf\_Regtable\_Entry3\_s Struct Reference

Collaboration diagram for Dwarf\_Regtable\_Entry3\_s:

**Public Attributes**

- [Dwarf\\_Small](#) **dw\_offset\_relevant**
- [Dwarf\\_Small](#) **dw\_value\_type**
- [Dwarf\\_Half](#) **dw\_regnum**
- [Dwarf\\_Unsigned](#) **dw\_offset**
- [Dwarf\\_Unsigned](#) **dw\_args\_size**
- [Dwarf\\_Block](#) **dw\_block**

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## 10.13 Dwarf\_Sig8\_s Struct Reference

**Public Attributes**

- char **signature** [8]

The documentation for this struct was generated from the following file:

- [/home/davea/dwarf/code/src/lib/libdwarf/libdwarf.h](#)

## Chapter 11

# File Documentation

## Chapter 12

# checkexamples.c

[checkexamples.c](#) contains what user code should be. Hence the code typed in [checkexamples.c](#) is PUBLIC DOMAIN and may be copied, used, and altered without any restrictions.

[checkexamples.c](#) need not be compiled routinely nor should it ever be executed.

To verify syntactic correctness compile in the libdwarf-code/doc directory with:

```
cc -c -Wall -O0 -Wpointer-arith \
-Wdeclaration-after-statement \
-Wextra -Wcomment -Wformat -Wpedantic -Wuninitialized \
-Wno-long-long -Wshadow -Wbad-function-cast \
-Wmissing-parameter-type -Wnested-externs \
-I../src/lib/libdwarf checkexamples.c
```

### 12.1 /home/davea/dwarf/code/src/bin/dwarfexample/jitreader.c File Reference

### 12.2 /home/davea/dwarf/code/src/bin/dwarfexample/showsectiongroups.c File Reference

# Chapter 13

## dwarf.h

[dwarf.h](#) contains all the identifiers such as DW\_TAG\_compile\_unit etc from the various versions of the DWARF Standard beginning with DWARF2 and containing all later Dwarf Standard identifiers.

In addition, it contains all user-defined identifiers that we have been able to find.

All identifiers here are C defines with the prefix "DW\_" .

### 13.1 dwarf.h

[Go to the documentation of this file.](#)

00051 dwarf.h DWARF debugging information values
00052 $Revision: 1.41 $ $Date: 2006/04/17 00:09:56 $
00053
00054 The comment "DWARF3" appears where there are
00055 new entries from DWARF3 as of 2004, "DWARF3f"
00056 where there are new entries as of the November 2005
```

```

00057     public review document and other comments apply
00058     where extension entries appear.
00059
00060     Extensions part of DWARF4 are marked DWARF4.
00061
00062     A few extension names have omitted the 'vendor id'
00063     (See chapter 7, "Vendor Extensibility"). Please
00064     always use a 'vendor id' string in extension names.
00065
00066     Vendors should use a vendor string in names and
00067     wherever possible avoid duplicating values used by
00068     other vendor extensions
00069
00070     The DWARF1 comments indicate values unused in
00071     DWARF2 and later but used or reserved in DWARF1.

# Chapter 14

## libdwarf.h

[libdwarf.h](#) contains all the type declarations and function declarations needed to use the library. It is essential that coders include [dwarf.h](#) before including [libdwarf.h](#).

All identifiers here in the public namespace begin with DW\_ or Dwarf\_ or dwarf\_ . All function argument names declared here begin with dw\_ .

### 14.1 libdwarf.h

00081 libdwarf.h
00082 Revision: #9 Date: 2008/01/17
00083
00084 For libdwarf consumers (reading DWARF2 and later)
00085
00086 The interface is defined as having 8-byte signed and unsigned
00087 values so it can handle 64-or-32bit target on 64-or-32bit host.
00088 Dwarf_Ptr is the native size: it represents pointers on
00089 the host machine (not the target!).
00090
00091 This contains declarations for types and all producer
00092 and consumer functions.
00093
00094 Function declarations are written on a single line each here
00095 so one can use grep to each declaration in its entirety.
00096 The declarations are a little harder to read this way, but...
